Chem.: $C_4HO\begin{matrix}CO(C_2H_5)O \\ (COHO)_2\end{matrix}$ Ethyl meconic acid. Obtained by passing dry hydrochloric acid gas into a solution of meconic acid in absolute alcohol. It forms small needles soluble in water, ether, and alcohol, melts at 158°, and sublimes in brilliant rhombs.

Chem.: $C_{21}H_{23}NO_4$. One of the alkaloids present in the aqueous extract of opium, discovered by Hesse in 1870. It forms a brownish, transparent, amorphous mass, it soluble in water, but very soluble in alcohol, ether, benzol, and chloroform. It melts at 58°, and is not sublimable. The salts of meconidine are very unstable, and their solutions have an intensely bitter taste.

mĕc′-ō-nĭn, *s.* [Eng., &c. *mecon(ium)*; suff. *-in.*]

Chem.: $C_{10}H_{10}O_4$. A neutral substance existing in opium, first observed by Dublanc. It can be formed from narcotine by the action of dilute nitric acid, and from opianic acid by treatment with caustic alkalis. It may also be obtained from opium by allowing a cold-water extract to stand for some weeks, redissolving the crystalline deposit in alcohol, and again crystallizing. Meconin crystallizes in colourless hexagonal prisms, soluble in boiling water, alcohol, and ether; slightly soluble in cold water. It has a very acrid

taste, melts at about 98°, and distils without alteration. It forms substitution derivatives with bromine, iodine, &c., of which bromomeconin is the type, $C_{10}H_9BrO_4$.

¶ The term *mediator*—Gr. μεσίτης (*mesitēs*), literally, an intermediary, an intercessor, a go-between, from μέσος (*mesos*) = the middle, and εἶμι (*eimi*) = to go—is applied in the New Testament to Moses and to Christ. The former was invited to hold interviews with Jehovah, carrying messages from Him to the Israelitish people and back again (Exod. xix. 3, 7, 8, 20, xx. 22, xxi. 1, &c.). He also interceded for them when they had sinned (xxxii. 30-32). The Jewish covenant or testament was "ordained through angels by the hand of a mediator" (Gal. iii. 19, R.V.); Jesus was the mediator of the new and better covenant or testament (Heb. viii. 6, ix. 15, xii. 24). In the fullest sense, that of an intercessor, there is no mediator but Christ Jesus (1 Tim. ii. 5). He ever lives to make intercession for those who come unto God by him (Heb. vii. 25; cf. John xvii.). It is for his name's sake that sins are forgiven (Ephes. iv. 32; 1 John ii. 12).

(1) Physic, a remedy, a remedial agent, an antidote to disease; any substance prescribed for the alleviation or removal of disease.

¶ Medicines are administered, as a rule, by the mouth, but sometimes also by the rectum, by inhalation into the lungs, by hypodermic injection into the cellular tissue, or in some rare cases by injection into the veins. Garrod makes three divisions of medicines: (1) Internal remedies, administered for their effects upon the system, both before and after absorption into the blood; (2) external remedies, which act locally, and are not intended to affect the constitution; (3) chemical agents used for other than their medicinal properties. Under the first division are four classes, with nine sub-classes; the second and third have only orders.

(2) A science and art directed first to the preventiou of ,diseases, and secondly to their cure; the practice of medicine as distinguished from that of surgery or midwifery, but not entirely separable from either, involving also a sound knowledge of anatomy, physiology, pathology, chemistry, and allied subjects.

"The miserable have no other *medicine* than only hope."—*Shakesp.: Measure for Measure*, iii. 1.

II. *Technically:*

1. *Science:* In the same senses as I. 1 & 2.

2. *Anthrop.:* This word is used in translating certain terms in the languages of the American aborigines which denote not only "medicine" proper, but anything the operation of which they do not comprehend; that is, anything mysterious, supernatural, sacred. Hence we have *medicine-man* = the doctor and conjuror of the American Indians; *medicine-bag* = the bag in which his remedies and charms are contained; *medicine-feast* = a sort of religious festival, consisting of singing, feasting, and dancing, and attended only by men; *medicine-hut* = the hut in which these feasts are held; *medicine-pipe* = the ornamented pipe smoked on these occasions. (*Bartlett*).

"They may have been handed down through successive generations as great *medicines.*"—*Wilson: Prehistoric Man*, i. 130.

3. *Hist., &c.:* The first attempts at medical and sanitary practice seem to have been made by, or under the direction of, priests. Perhaps the wearing of amulets was one of its earliest forms. To this day, in India, many children go to school with a bit of string round their wrist, which has had incantations muttered over it by Brahmins, and is considered a preservative against fever. Such a string (intrinsic value not a farthing) is charged half a rupee or a rupee (about 1s. or 2s.), according to the time for which its virtues are guaranteed. With this superstition are joined actual remedies discovered by observation. Part of the Vajur Veda treats of medicine. The Egyptians are credited with some proficiency in the art; their embalming of bodies must have taught them the elements of anatomy. The medical and sanitary arrangements of the Mosaic law are well known (Lev. xiii., xiv. I–8; Deut. xxiii. 13, &c.). Chiron, the fabled Centaur, is said to have brought some knowledge of medicine from Egypt to Greece. His pupil was Æsculapius, said to have lived previously to the Trojan war [abont 1500 B.C. (?)]. He was so eminent a physician that he was, on his death, deified, and became the Greek god of medicine, under whose auspices all further researches were made. Pythagoras, about 529 B.C., studied the human frame; but the "father" of Greek medicine was Hippocrates, B.C. 460–442. He is by some considered the founder of the dogmatic school. About 332 B.C. the Alexaudriau school arose, under Eratosthenes and Hierophilus. The latter was opposed by Chrysippus, and the empiric school arose. The Romans were long in entering the field. The greatest Roman physician was Galen, A.D. 165. The Methodics had arisen shortly before, and the Eclectics were ramifications of the former. From the seventh to the twelfth century the Arabs cultivated medicine; their greatest name was Avicenna, about 1020 A.D. The Italians next assumed the lead. The dogmatic school of medicine was assailed by Paracelsus (1493–1541) and Vesalius (1514 to 1564). The discovery by Harvey, in 1628, of the circulation of the blood, gave a great impulse to medical science. The extensive range of study which this science now embraces will be evident from the list of subjects taught in King's College, London. They are Anatomy, Physiology, Pathological Anatomy, Comparative Anatomy, Botany, Chemistry, Hygieine, Materia Medica, Medicine, Clinical Medicine, Forensic Medicine, Midwifery, Clinical Surgery, and Ophthalmology.

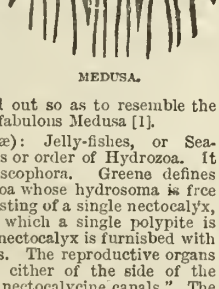
Myth.* (*Of the form* Medusa): One of the Gorgons who, giving offence to Minerva, had the fine hair, on which she prided herself, turned to serpents; her eyes were also endowed with the power of converting every one who looked at her into stone. There are some unimportant variations in the myth.

2. *Zoology:*

(1) (*Of the form* medusa): Jelly-fish, the typical genus of the family Medusidæ (q.v.). It consists of an umbrella-like disc surrounded by numerous short filiform tentacles. From the lower part of the umbrella hang four long arms with membranous fringed margins. The most common species is *Medusa aurita,* which is often seen on sandy sea shores like a mass of jelly. The genus is so named because the organs of motion on the animal spread out so as to resemble the snaky hair of the fabulous Medusa [1].



MEDUSA.

(2) *Pl.* (Medusæ): Jelly-fishes, or Sea-nettles, a sub-class or order of Hydrozoa. It is called also Discophora. Greene defines them as "Hydrozoa whose hydrosoma is free and oceanic, consisting of a single nectocalyx, from the roof of which a single polypite is suspended. The nectocalyx is furnished with a system of canals. The reproductive organs are as processes, either of the side of the polypite or of the nectocalycine canals." The edge of the umbrella is fringed with thread-like tentacles. Lines, often eight in number, pass from the top of the disc to the circumference, uniting in a canal passing all round the edge. The month, which is on the lower side, opens into a stomach, which is surrounded by four coloured circular spots. The Jelly-fishes, or Sea-nettles, move through the water by contracting and expanding their umbrella-shaped discs. The sub-class or order Medusæ (or Discophora) does not contain all Cuvier's Acalephæ, and it is in further process of reduction as various members of it are successively proved not to be mature species, but only the free generative buds or gonophores of other Hydrozoa. Nicholson makes the Medusæ contain only one family, Medusidæ. Prof. Martin Duncan has two sub-orders, Pelagida and Rhizostoma (q.v.).

contain medullary cavities, it is clear that Megalosaurus was terrestrial. That it was carnivorous is evidenced by the teeth, of which Buckland (*Bridgewater Treatise*, p. 296) says: "In their structure we find a combination of mechanical contrivances analogous to those which are adopted in the construction of the knife, the sabre, and the saw."

Gray gave a list of twenty species, of which sixteen were in the British Museum. Since then the number of species has been fixed at seventeen (Schlegel), and again at nineteen (Oustalet). They are found in the Samoa Islands, the Tonga group, the New Hebrides, the northern portion of Australia, in New Guinea and the neighbouring islands, in the Celebes, the Pelew islands, the Ladrones, the Philippines, Labuan, and the Nicobars. They are about the size of small fowls, the head generally crested, the tail very short, feet enormously developed, and, with the exception of *Megapodius wallacii*, from the Moluccas, have sombre plumage. The popular name has reference to the peculiar habits of these birds. They heap up large mounds, of which vegetable matter is the principal component; in the centre of this mass they deposit their eggs, and covering them up, leave them to be hatched by the heat of the fermenting vegetable matter.

Lycll says that it is quite indistinguishable in external appearance from basalt, but is, as a rule, not so heavy, dark, or compact, does not contain so much oliviue, but has more silica and alumina, with less oxide of iron, lime, and magnesia. Rutley thinks it has more affinity to basalt than to diabase, and is not sure that it is distinct. Rosenbusch regards it as closely related to or identical with olivine diabase. Allport thinks it a partially altered dolerite. It is dark in colour, and cousists of plagioclase, augite, olivine, iron, magnetite, or titaniferous irou, and delessite, or chlorophœite. It is of Palæozoic age. The Rowley Hills in Staffordshire, commonly known as Rowley Ragstone, are melaphyre.

Eccles. & Ch. Hist. (*Pl.*): Royalists; a name given to those Greek Christians in the East, who, after the Council of Chalcedon (Fourth General, A. D. 451) remained orthodox, following the example of the Byzantine Court. As they followed Constantinople at this junctnre, in remaining in communion with the West, so they cast in their lot with that patriarchate when the Greek schism took place. In 1686 the Patriarch of Antioch returned to the Roman obedicnee, and since then the patriarchates of Alexandria and Jerusalem have also submitted. This prelate is chosen by the bishops of the patriarchate, but the election must be examiued and approved by Propaganda, and confirmed by the Pope. The bishops may be chosen from the unmarried secular clergy. The latter may continue to live as married men, if married before receiving orders. The Melchites retain their own rites, and in 1865 their number was estimated at about 35,000. (*Addis & Arnold.*) [MONOPHYSITES.]

Meletian schism, *s.*

Eccles. & Church History:

1. A schism arising from the conduct of Meletius, Bishop of Lycopolis, in the Thebaid, and lasting from A.D. 304 till the middle of the fifth century. Its proximate cause is involved in obscurity. By some writers, it is said that, during the Diocletian persecution, Meletius ordained priests beyond the limits of his own dioccse. Other writers attribute the rise of the schism to a dispute between Meletius and Peter, Patriarch of Alexaudria, on the subject of the Lapsed (q.v.). According to Athanasius, Meletius sacrificed to idols during the persecution; but Hefele is of opiniou that Athanasius must have been misled by a false report, as Epiphanius speaks of Meletius in terms of commendation. The Council of Nice (A.D. 325) dealt with the matter, but the Meletians managed to evade, to a great extent, the conditions imposed on them.

2. A schism arising from the deposition of St. Meletius, Bishop of Antioch. It lasted from the sixth decade of the fourth to the beginning of the fifth ceutury. (*Addis & Arnold.*)

Ornith.: True Honey-eaters; a family of Perchers, sub-order Turdiformes, group Cinnyrimorphæ (Honey-eaters). The tongue is doubly cleft, and pencilled at the tip; the nostrils long and shut in with a large horny membrane on the upper edge; the bill with a notch; the hind toe and claw long and strong. They inhabit Australia and Oceania. The tongue is long, protrusible, and terminated by a little tuft or pencil of fibres, which are of great service to the birds in extracting the honey of flowers. Usually they are destitute of song. The habits of all the species are very uniform. They frequent flowering shrubs and trees, particularly the Eucalyptus, for the sake of their pollen and nectar, and also in search of the small insects which are attracted to the flowers from the same cause. Some of the larger species also feed on fruit. The nests are sometimes made in bushes, sometimes suspended from the tips of slender twigs. Two eggs are usually laid.

Entom.: A genus of social bees, intermediate hetween Apis and Bomhus, but more akin to the latter. *Melipona domestica*, a Mexican species, described and figured hy Pierre Huber, builds cells of two kinds, some small cylindrical ones for the larvæ, and others large for holding honey; the latter are intermediate in structure between the cells of the humble bee and the hive bee. In studying the formation of the honey-comb Darwin found that the hexagonal comb was far more probably a result of the circumstances surrounding the hees than an outcome of a mathematical instinct. He found that while some bees build separate, irregularly rounded cells, others built the beautiful hexagonal cells which have heen so greatly admired. The Mellipona act as the connecting liuk between these two forms. *Melipona domestica*, in forming its large spherical honey cells, places them so close together that if completed the spheres would intersect. To prevent this the hees close the opening hetween two contiguous cells with a flat plate of wax, so that each cell is made up of a general spherical surface, with two, three, or more flat portions. As one cell often rests against three others, a pyramid is formed hy the union of three flat surfaces. The result is an approach to the hive-comh type, which would result from this operation if the Mellipona should make their spheres at a fixed distance from each other and of equal size. In the case of the hive bee this is done. Each bee, working within its cell, and seeking to make it of a fixed size, finds it in contact with the cells of other bees, and is thus obliged to construct it with flat instead of rounded sides, the regularity with which it is surrounded by other cells yielding usually, but not always, the mathematically correct hexagonal cell.

1. *Zool.:* Ratel, or Honey-hadger. A genus of arctoid mammals, family Melidæ. Ashy gray on upper surface, black heneath. About twenty-seven inches in length, of which the tail takes up from four to five inches. The dentition is interesting, the molars being $\frac{1-1}{1-1}$, as in the Felidæ. The ratel lives largely on hees, which it tracks to their nests, and on birds, tortoises, and insects. Two species are known; *Mellivora capensis*, the Cape Ratel, from South Africa, and *M. indica*, the Indian Ratel. The first named of these closely resembles the Badger, both in size and form, though perhaps heavier in appearance, and with its nose less prouounced. It burrows in the ground like the Badger, not only to provide itself a habitation, but also in search of the honey of the wild bees, of which it is immoderately fond. It has the same loose hard skin as the ordinary Badger, and in this armor is heedless of the stings of the bees whose nests it robs.

About ten species are known, principally from New Guinea; most of them are ornamented with a variety of colours; the living shell is covered with a greenish-brown epidermis. The foot is large and thick; the eyes are at the bases of the tentacles.

mĕ-lō′-dĕ-ŏn, *s.* [Melody.]

Music:

1. A wind-instrument with a row of reeds and operated by keys. In 1846 a method of drawing air through the reeds by suction-bellows was patented. Pressure on the key drives down the pin and the valve, allowing passage to the air. The principle is the same as that of the accordeon. The Melodeon, once so popular in the United States, is a wind instrument of the type of the Harmonium, operated by a foot bellows, by whose aid a current of air is forced through slits containing free vibrating reeds, yieldiug a continuous musical sound, acute or grave according to the size of the reed. It is particularly adapted to music of a serious character, and has been greatly used in this country for the rendition of church music, instead of the livelier piano. The American Parlor or Cabinet Organ now largely takes its place.

mĕl′-ō-dra-ma, * **mĕl′-ō-drame,** *s.* [Fr. *mélodrame* = acting with songs; Gr. *μέλος* (*melos*) = a song, and *δρᾶμα* (*drama*) = an action, a drama (q.v.).]

1. *Orig.:* A dramatic piece in which the interest is heightened by the character of the vocal or instrumental music accompanying certain situations. The melodrama is of French invention, and was introduced into England at the end of the last century; the subjects are generally of a romantic character, illustrated with picturesque costumes and scenery, and having serious and sensational incidents. Although sometimes confounded with the opera, it differs from that higher class of work insomuch that the action is carried on in speaking and not in recitative and aria. [Opera.]

"This narrative, as it is given in Livy, resembles a scene in a *melodrame,* rather than an event in real history."—*Lewis: Cred. Early Roman Hist.* (1855), ii. 346.

2. *Now:* A play of strong situations, resembling both the domestic and the sensational drama, and characterized more by bold colouring than artistic finish. The more thrilling passages are accentuated by musical accompaniments known as the "hurries," the only relic of the original musical character of the melodrama, which has now come to designate a romantic play, depending mainly on sensational incidents, thrilling situations, and an effective denouement, and often paying little attention to probability or naturalness of incident in the effort to produce strong effects. Such pieces are often staged at great expense for scenery, costume, and mechanical arrangements; moving machinery, locomotives that cross the stage, falling bridges, burning houses, and a great variety of such mechauism being introduced. The melodrama is to some extent abandoned to second-class theatres, yet it often invades those of the first-class, displacing the legitimate drama to satisfy the public taste for strong effects and exciting situations. Much of the more recent drama contains a considerable infusion of the melodramatic element, and the pure drama of sparkling dialogue and unfolding character is largely replaced by that of thrilling iucident and mechauism.

Entom.: A genus of lamellicorn beetles, typical of the group Melolonthides (q.v.). *Melolontha vulgaris* is the well-kuown Common Cockchafer (q.v.). It is seldom sufficiently numerous in England to prove very destructive; but the damage done by these insects in the department of Seine-Inférieure in 1866 was estimated at more than a million sterling. The larva takes two years to complete its growth, ten months of which are passed in hibernatiou; the pupa state lasts eight, and that of the adult insect nearly four months, of which rather less than twenty days is passed in the free state, depositing its ova. It is active only in the twilight. Its favourite food is the foliage of oak and elms.

mĕl'-ōn, * **mel-oun,** *s.* [Fr. & Sp. *melon*; Port. *melão*; Ital. *mellone*, all from Lat. *melo*; Gr. *μῆλον* (*mēlon*) = an apple or any tree fruit.]

1. *Bot., Hort., &c.: Cucumis Melo.* Linnæus, who discriminated it from others of the genus by the angular points of the leaves being rounded off and its torulose, *i.e.*, knotted, fruit, says that it is a native of the Kalmuck country (in Tartary). De Candolle considered it to come from the valleys south of the Caspian Sea, and from those of Mount Caucasus. It was early cultivated. It was so in Egypt [2]. It is supposed to have been the *σικυος* (*sikuos*) of Theophrastus, the *σίκυος πέπων* (*sikuos pepōn*) of Hippocrates, the *πέπων* (*pepōn*) of Dioscorides, the *melopepo* of Galen (the name being given from its resemblance to the apple), and the *melo* of Pliny. Till lately the plant was called muskmelon, to distinguish it from *Citrullus vulgaris*, water-melon. The melon is of the same genus as the cucumber, but differs from the latter in the shape and sweet taste of its fruit, and in its peculiar but pleasant smell aud flavor. It is an annual, with trailing or climbing stem, small, yellow flowers, and large rounded fruit. It has been cultivated from a very ancient period, and is not known in a wild state, though supposed to be a native of the subtropical parts of Asia. The varieties in cultivation are very numerous, distinguished by the smoothness or roughness of the rind, which is often furrowed, or crossed by net-like cracks; by the color of the flesh of the fruit, which is green, yellow, red, &c.; and by its size, which may vary from 3 inches to more thau a foot in diameter. In the United States this fruit has gradually lost its name of melon—which is now restricted to the water-melon—and is ordinarily known as the cantaloupe. Of these the netted forms are the sweeter, the large and smooth kinds being rarely popular. They sometimes grow to a great size. Cantaloupes of 16 lbs. weight having been raised in California. Water-melons have been produced in South Carolina of 45 lbs. weight. Both these fruits are raised in enormous quantities, and are very popular as dessort fruits, their culture extending from New Jersey to the Gulf States. There are other species of the melon. South Africa possesses *C. Caffer*, a water-melon which is very valuable to the inhabitants. *C. utilissimus*, the Kaukoor of India, has a fruit which will keep for months, and is much used both raw and in curries, or pickled in its green state. The seeds are ground for meal, and contain much oil, which is expressed and used for food and in lamps.

2. *Script.:* Heb. אַבַּטִּחִים (*abhattichhim*). Num. xi. 5, seems to be correctly translated, as in the A.V., melon. Dropping the plural termination, ים (*im*), the word is like the Arabic *butikh* = the melon.

Music: An invention by which sustained sounds can be produced on a pianoforte. It consists of a series of small hammers set into very rapid vibration by the winding up of a spring. When a note is struck and held down, the constant repetition of the blows of the hammer causes a continuous vibration of the string which is of a most charming character. An admirable crescendo is obtained by the ingenious plan of raising the hammers gradu-

ally farther from the string, the force, of course, being proportioned to the distance they have to fall. The melopiano was invented by Caldara of Turin in 1870.

melting-furnace, *s.* A foundry cupola, or a glassmaker's furnace. Melting furnaces are built of fire-clay or other intractible material, capable of sustaining without injury the highest ordinary temperatures. Those for glass melting are square, oblong, or circular in shape, the fire space or grate in the centre, with doors or other openings for feeding in the fuel. In general no flue or chimney is directly connected with the furnace, the only exit for the products of combustion being the working holes, so that the greatest heat is concentrated around the pots of melted glass placed opposite these holes. A furnace may contain from 4 to 10 pots, so placed that they can be charged through the working holes, and the melted glass taken out at these holes. There have been of late years many improvements in glass furnaces, facilitating their continuous operation. Furnaces for melting iron are constructed with chimneys, up which the products of the blast are carried, while the melted metal is drawn off at a tap hole in the side of the cupola. Furnaces for melting other metals are similar to those named in character, with special appliances dependent on the conditions of the operation.

membrana tympani, *s.*

Anat.: The drum of the ear. This membrane is nearly oval in shape, closing the space between the inner and the outer ear, and placed so as to slant inwards and form an angle of about 45 degrees with the floor of the auditory canal. The handle of the malleus (or hammer), the first of the chain of small bones of the ear, is firmly attached to this membrane, and draws it inward, rendering its external surface concave. This membrane is thrown into vibration by the waves of sound in the air, which enter the ear canal and impinge upon it. Its vibrations always equal in number those of the body from which the sound emanates. These vibrations are communicated to the malleus, and from it, through the chain of bones, to the membrane of the *fenestra ovalis*, and, through the fluids and vibratory chords of the inner ear, to the nerves of hearing. The whole mechanism is a remarkable instance of nature's adaptations.

mĕm'-brāne, *s.* [MEMBRANA.]

Anat.: An expansion of any tissue in a thin and wide layer. Bichat divides them into serous, mucous, and fibrous membranes. Among the most important membranes in the body are those of the brain: viz., the dura mater, the arachnoid, the pia mater and the falx. The mucous membranes are those which line the canals or cavities of the body which are open to the air, and exposed to its action or that of foreign bodies. These membranes include the lining of the nose and mouth, the branchiæ, œsophagus, stomach, intestines, &c. They exude a thick semi-fluid matter, named mucous, which becomes abnormally abundant in the case of that affection of the air passages known as a cold. The skin and true glands are also included in the mucous system of the body, they being continuous with one another. The serous membranes line the closed cavities of the body, including such internal sacs as those of the chest, the abdomen, &c. These exude a watery fluid called serum, which serves as a lubricant of the internal surfaces. The fibrous membranes are tough, elastic, and of a tendinous character. They include the membranes of the brain, above mentioned, the pericardium, or heart envelope, the capsules of the joints, &c. In addition to the membranes named are the placental membranes, in which the fœtus is enclosed, and through which it is nourished. These membranes are shed after delivery as the after-birth. membranous-labyrinth, *s.*

Anat.: Membranous structures inside the osseous labyrinth of the ear, and having spread over them the ultimate ramifications of the auditory nerve. The internal ear, or labyrinth, is a complicated organ, being made up of three parts, known as the vestibule, the semicircular canals, and the cochlea, forming a complex series of cavities lying within the hardest part of the petrous portion of the temporal bone. This dense bone is known as the osseous labyrinth, and is partly lined by the membranous labyrinth, the latter being considerably smaller, and in great part separated from the bone by a fluid called the perilymph. 1. A memorial account; a history composed from personal experience and memory; an account of transactions in which the narrator bore a part; an account of matters connected with some period of history, but less full and formal than a history proper.

¶ History owes much of its best material to the "Memoirs" which have been from time to time produced, whose authors have undertaken to describe the interesting events which have

fallen under their own observation, and have thus thrown a side light of illustration upon the manners and customs of their times of which ordinary annals are quite devoid. The Memoirs of modern writers answer to what the Romans called *commentarii* (commentaries), of which Cæsar's "Commentaries" are the most notable example. The French exceed all modern nations in piquant and characteristic Memoirs, which abound in individual anecdotes, and often reveal the character of events which are barely hinted at in general history. If written by a truthful person Memoirs form the most entertaining and trustworthy portion of history, though too often they are marred by partisanship and untruthfulness. Thus Grammont's "Memoirs" are indispensable to those who would understand the men and women of the Restoration of Charles II. of England, and Sully's "Memoirs" light up the whole period of the wars of Henry IV. of France.

"There is not in any author a computation of the revenues of the Roman empire, and hardly any *memoirs* from whence it might be collected."—*Arbuthnot: On Coins.*

II. *Technically:*

1. *Mental Phil.:* The mental faculty or power which causes the impressions of bygone events, at ordinary times latent in the mind, to affect it anew or to be reproduced by an effort for the purpose. In the first case, it will be found that the principle which has created the old impression spontaneously to affect the consciousness again has been the association of ideas. The ideas connected with the long latent impression had been for some cause prominently before the mind, and they brought up with them the latent one unsummoned. When a conscious effort is made to recall some half-forgotten incident, aid is sought from the same principle of association of ideas. One attempts to remember what happened at the same time and place as the incident which he seeks to recall, and it tends to come back in their company. If in place of an historical, what is forgotten is a scientific fact or law, association of the time and place at which it first became known to us will, as in the other case, aid in its recall, besides which there is logical and philosophical connection between it and other facts. General laws exist and natural classification and arrangement. Historic incidents also can be linked together naturally by regarding each as the consequence of some known antecedent one, and as the antecedent of some one immediately following. Ordinary minds remember incidents and facts by association of ideas of the first and more artificial kind: philosophers aim at doing so by the second and more natural kind of association. Men vary greatly in the value of their memories. A memory to be good should be susceptible, ready, and retentive. (See these words.) The keener one's susceptibility, the more interested he will be in human affairs, the more attention he will pay to all objects of sensation, and the more easily he will remember them; the more that reflective coexists in his mind with perceptive power, the more permanent will be the impression. The old, losing interest in recent events, as their mind and body decay, complain of difficulty in remembering them.

"This laying up of our ideas in the repository of the *memory*, signifies no more but this, that the mind has a power in many cases to revive perceptions, which it has once had, with this additional perception annexed to them, that it has had them before."—*Locke: Hum. Underst.*, bk. ii., ch. x., § 2.

¶ When an event or fact is recalled to the mind by an effort made for the purpose, this is not memory of the normal kind but recollection. The art which furnishes aid to memory is called Mnemonics (q.v.). Even ordinary recollection, according to Cicero, has some element of artificial association, and is not purely spontaneous. The impressions of facts are associated together in the mind, and if one is recalled from any cause the others are likely to accompany or succeed it. There are systems of mnemonics in use which are all based on this principle, of recalling a difficult mental impression by associating it with another that is easily recalled. Numbers, for instance, may be associated with letters of the alphabet. The date 871 has no direct association with King Alfred, and one does not necessarily recall the other. But if 8 be taken to mean *a*; 7, *m*; and 1, *i*, then the word *ami*, if associated with King Alfred, will at once recall the date. This is one of various methods of artificial memory that have been employed. The old rhyme "Thirty days has September," &c., clings to the memory of thousands, and is to many of the greatest service in quickly recalling the number of days in each month. There are few of us that do not use mnemonics to some extent, and find great utility therein.

2. *Physiol.*: This faculty is the property of the cerebral organs only, not of the organ of sense, and is never entirely lost except through disease or accident. Church Hist. & Eccles.: A sect founded by Ægidius Cantor, an illiterate man, and William of Hildenissen, who was a Carmelite and better instructed. The sect was first discovered in Brussels in 1411. They trusted for salvation to Christ alone, and denied that confession and voluntary penance were necessary to salvation. With these tenets were combined some mystic views that a new law of the Holy Spirit and of spiritual liberty was about to be promulgated. They may have been a branch of the sect called Brethren of the Free Spirit. (*Mosheim: Church Hist.*; cent. xv., pt. ii., ch. v., § 4.)

Mendicant Friars, *s. pl.* [Mendicant Orders.]

Mendicant Orders, *s. pl.*

Eccles. & Church Hist.: Monastic orders, which, by their rule, were forbidden to acquire landed property in any manner whatsoever, but were compelled to subsist on alms, in many instances in their early history, and in some cases even now, in some countries under the Roman obedience, actually gathered by begging. They date from the thirteenth century, and at first consisted of the Carmelites, the Dominicans, and the Franciscans. In the latter half of the century the Angustinians became a mendicant order, and the Servites were recognised by Pope Innocent VIII., in 1487, as a fifth mendicant order. Hallam notes that these new preachers at first were received with approbation by the laity, whose religious zeal depends a great deal upon their opinion of the sincerity and disinterestedness of their pastors. It is noticeable that the supineness and corruption which they imputed to the secular clergy came, in time, to be imputed to them also.

Mendicity Society, *s.* The usual name by which the Society for the Suppression of Mendicity is known. It was established in London in 1818. The plan of the institution is, the issue of printed tickets to be given to street beggars instead of money; which tickets refer them to the Society's office, where their cases are investigated and disposed of according to circumstances. In all suitable cases a labour test is imposed. Constables in plain clothes are employed to arrest vagrants and impostors, and of these alone 62,460 were registered in the Society's books up to March, 1885. A Begging-letter department was established a few years after the formation of the Society, and up to the date mentioned above 204,449 begging-letters had been referred to the Society by subscribers for investigation.

Ichthy: *Alosa menhaden*, one of the Clupeidæ, abounding in the waters of New England and as far south as Chesapeake Bay. It is also called Bony-fish, White-fish, Hardhead, Moss-bunker, and Pauhagen. In Massachusetts and Rhode Island they are known by their native name; in New York as Moss-Bunkers and Skippaugs. The economic value of this fish, surpassed in America only by that of the Gadoids, is derived chiefly from its use as bait, and from the oil extracted from it, the annual yield exceeding that of the whale from American fisheries. The refuse of the oil-factories supplies a material valuable for artificial manures.

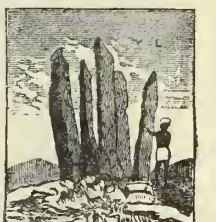
Chem.: An oil obtained from a species of herring, *Alosa menhaden.* When distilled with excess of lime, it yields not less than sixty volatile hydrocarbons.

mĕn'-hĭr, *s.* [Gael. & Wel. *maen* = a stone and *hir* = high.]

Archæol. & Anthrop. (*Pl.*): Tall stones; the last of the classes into which Megalithic monuments are usually divided. They occur singly and in groups, rough and unhewn, and sculptured and inscribed with Ogham writing or with runes. They are found in Ireland and Scotland, in Scandinavia, in Algeria, and in the Khassia Hills, Bengal. In the latter instance many of the stones are recent, and Major Austen (*Journ. Anthrop. Inst.*, i. 127) thus accounts for their creation:



MENHIR.

"If any of the Khassia tribe falls ill or gets into difficulties, he prays to some one of his deceased ancestors, whose spirit he fancies may be able and willing to assist him . . . and, to enforce his prayer, he vows that, if it is granted, he will erect a stone in honour of the deceased."

Fergusson's view as to the origin of European menhirs generally may be gathered from the extract:

"We can trace back the history of the *menhirs* from historic Christian times to non-historic regions when these rude stone pillars, with or without still ruder inscriptions, were gradually superseding the earthen tumuli as a record of the dead."—*Fergusson: Rude Stone Monuments*, p. 60.

The premonitory symptoms are usually well marked, as headache, gradually getting worse, heaviness, giddiness, irritability, and frequently sickness and vomiting. When the disease is established, it presents the following stages: (1) Excitement; (2) Transition; (3) Depression. The extent of the inflammation and its position on the brain determine the symptoms. There are acute and chronic forms of the malady. The former generally terminates in death; whilst the latter results first in maniacal excitement, and then in idiocy.

Eccles. & Church Hist. (*Pl.*): The followers of Menno Simons (1492–1559), a priest at Witmarsum, in Friesland, who resigned his position from religious convictions. His teaching was ascetic rather than dogmatic, except that he was antipædobaptist. The discipline of the Mennonites involved separation from the world, to the extent of refusing to bear arms or to fill any civil office. There was no hierarchy, but exhorters were chosen by the congregations, each of which was independent of all the rest, and from these exhorters elders were selected to administer the sacraments. The Mennonites spread over Switzerland, Germauy, Holland, and even to France. Their chief home now is in the United States and Canada, where they number nearly 200,000. There are also some German Mennonite colonies in Southern Russia.

"The *Mennonites* of Holland have passed through an interesting and progressive history."—*Encyc. Brit.* (ed. 9th), xvi. 12.

The Roman doctrine is, that the reservation, to be lawful, must be of such a character that it may be perceived by the person to whom it is addressed; and, even when mental reservation is permitted, it is always to be used with caution, and only as the less of two evils. Jeremy Taylor (*Ductor Dubitantium*), from an Anglican, and Liguori (*Theol. Mor.,* lib. iv.) and Cardinal Newman (*Hist. Relig. Opin.* and *Apologia*) from a Roman point of view, are excellent authoritics on the subject.

II. *Technically:*

Astron.: The planet nearest the sun, unless indeed it be established that the hypothetical Vulcan really exists. Its stationary points are from 15 to 20 degrees of longitude from the sun, hence it rises and sets not far from the time when the sun does so. The light of the sun and the haze of the horizon combine to render observation of the planet difficult; hence, as Sir John Herschel says, we "can see little more" of the planet "than that it is round, and exhibits phases." It varies in brightness from 15″ to 12″ of the celestial circle or vault. Hence it is sometimes telescopic, and at other times visible to the naked eye, being as bright as a star of the second magnitude. It was known to the ancients. Its diameter is about 3,200 miles; its mass about $\frac{1}{15}$th that of the earth; its sidereal period 87 days, 16 hours, 49 minutes, 30 seconds. It is seen at its greatest brightness as an evening star, at average intervals of about 116 days. Its average distance from the sun is 35,550,000 miles. Its greatest and least distances differ nearly thirteen million miles. It moves in its orbit about 109,360 miles an hour, against 68,040 performed in the same time by the earth. The orbit of Mercury is remarkable for its extreme eccentricity, the distance from the sun varying from about 30,000,000 to 43,000,000 millions of miles. The effect of this would be that, supposing there were any inhabitants of Mercury, within a period of about six weeks, the sun would double in apparent size, and give about double the quantity of light and heat. The planet is supposed to rotate on its axis in 24h. 5m. 28s. Transits of Mercury over the sun's disc occur like those of Venus, but more frequently; those

at the ascending node in November, those at the descending one in May. They are at intervals of about thirteen or seven years, and are now observed with the greatest interest by astronomers, who are thus enabled to make very accurate calculations of distance and magnitude by the employment of ingenious instruments designed for this purpose.

2. *Bot.:* The genus Mercurialis (q.v.).

3. *Chem.:* A diatomic metallic element; symbol Hg; atomic weight, 200; sp. gr. 13·59; boiling point, 357·25; known from the earliest historical times, and the only liquid metal at ordinary temperatures. It occurs most frequently in the form of mercuric sulphide, or cinnabar, an ore found in Spain, Austria, and other parts of the world, from which it is extracted by roasting the ore in a furnace, and conducting the vapours into a chamber where the mercury is condensed, while the sulphurous acid is allowed to escape. It possesses a lustre like that of polished silver, and solidifies at − 39·5° to a tin-white malleable mass, contracting at the moment of solidification. Hydrochloric acid is without action upon mercury. Cold sulphuric acid does not attack it, but the hot concentrated acid dissolves it with evolution of sulphurous anhydride. It is soluble in cold dilute nitric acid, mercurous nitrate being formed. Mercury is invaluable to the chemist, who employs it in collecting gases which are soluble in water. It is also used in medicine, in extracting gold and silver from their ores, in silvering mirrors, and in gilding.

4. *Class. Mythol.:* A Roman deity, identified with the Greek Hermes. He was the son of Jupiter and Maia. He was originally the god of traffic and gain (from Lat. *merx*, gen. *mercis* = merchandise, gain), and the protector of merchants and shopkeepers. Afterwards, being identified with Hermes, he was regarded as the god of eloquence and commerce and the protector of robbers. He was also the messenger and herald of the gods, and as such he was represented as a youth, lightly clad, with the petasus or winged hat, and wings on his heels, bearing in his hand the caduceus or emblem of his office as a herald, a rod with two serpents twined round about it.

5. *Med.:* The chief preparations of mercury used in medicine are calomel, corrosive sublimate, hydrargyrum cum creta, and blue pill. Mercury should not be given in anæmia, hectic, scurvy, scrofula, or tuberculous disease, nor in cirrhosis, melanosis, gangrene, fatty disease, or splenic diseases. In bilious affections, and dyspepsia, secondary syphilis, in some forms of diarrhœa, in minute doses, in iritis, and in acute and chronic rheumatism, it is a very valuable remedy, and in all forms of inflammation unaccompanied by dropsy. Its chief actions are absorbent, alterative, antiphlogistic, purgative, and also in a lesser degree tonic, stimulant, and sedative. Children usually stand it better than grown-up people; with them the best form of administration is the gray-powder, and for adults, calomel or blue pill; and in syphilis, corrosive sublimate. As an external application, calomel, or calomel and lime water (black wash) are also useful remedies.

6. *Min.:* An isometric mineral, fluid at ordinary temperatures. Volatilizes at 662° F., and may be crystallized in octahedrons at — 39° F. Sp. gr. 13·568; lustre metallic; colour tin-white; opaque; compos., pure mercury, with occasionally some silver. Occurs in small globules scattered through cinnabar (q.v.), or its gangue. The most important mines are those of Almaden, Spain, and Idria, Carniola. In the Pioneer mine, Napa Valley, California, quartz geodes are sometimes found which contain several pounds weight of mercury.

mercy-seat, *merci-seate, *s.*

1. *Lit. & Jewish Antiq.:* Heb. כַּפֹּרֶת (*kapporeth*); this may be from כָּפַר (*kaphar*) = to cover in the literal sense, or כִּפֶּר (*kipper*) = to cover figuratively, specially to cover sin. Hence, the Septuagint renders the word ἱλαστήριον (*hilastêrion*) = that which is propitiatory or offered in propitiation; and the Vulgate *propitiatorium* = an atonement, a propitiation. The golden covering placed upon the ark of the testimony. Whether it was the actual lid of that ark, or a tablet placed above the lid, is doubtful. Like the ark, it was two-and-a-half cubits (3 feet 9 inches) long, and one-and-a-half (2 feet 3 inches) broad. At each end was a cherub, the two looking face to face, and covering the mercy-seat with their wings. The whole was put in the most holy place of the tabernacle, and afterwards of the temple (Exod. xxv. 17-22, xxvi. 34, xxxvii. 6-9, xl. 20; 1 Chron. xxviii. 11). On the great day of the Atonement, Aaron, the high priest, cast incense on coal (charcoal) burning in a censer, and the cloud of sweet-scented spices which thence arose covered the mercy-seat, God, whose special dwelling when he visited the place was between the cherubims (Psalms lxxx. 1), appearing in the cloud (Lev. xvi. 12, 13). The mercy-seat was also sprinkled seven times with the blood of a bullock and a goat, offered as a sin-offering (Lev. xvi. 15). Jehovah spoke to Moses from off the mercy-seat (Num. vii. 89).

"And over it the cherubims of glory shadowing the *mercy-seat*; of which we cannot now speak particularly."—*Hebrews* ix. 5.

2. *Fig.:* In the New Testament the entry of the high priest into the most holy place is made symbolical of the entry of Christ into heaven, to pursue His work of intercession, and of the approach of the Christian to God by the blood of Jesus (Heb. x. 19-22), whence, in devotional language, an approach to the mercy-seat signifies an approach to God in prayer.

"Jesus! where'er thy people meet,
There they behold thy *mercy-seat*."
Cowper: Olney Hymns, xxvi.

mĕs'-mēr-ĭsm, *s.* [For etym. see def.]

Hist. & Med.: The system popularised by Franz Anton Mesmer (1733-1815), a Swiss physician, and by him called Animal Magnetism. He believed that the stars exercised an influence over men, and, identifying this with magnetism, sought to effect cures by stroking his patients with magnets. Finding that Gassner, a Swabian priest, effected cures by stroking with his hand, Mesmer abandoned the use of magnets, persuaded that some mysterious force preseut in himself was the means by which cures were effected. The French goverument offered him 20,000 francs for his secret, but he refused; and a commission was appointed to examine into the cures said to have been effected by him. They admitted many of the facts, but declined to admit that such an agent as animal magnetism existed. Mesmer delighted in mysterious surroundings, and affected a strange weird style of dress; but one of his disciples, the Marquis de Puysegur, showed that sleep might be induced by gentle manipulation alone, thus removing mesmerism from the sphere of mystery to one where it might be subjected to scientific investigation. In 1843, Mr. Braid, a surgeon of Manchester, investigated the subject. [Hypnotism.] In 1843, Baron von Reichenbach made public his views as to odyl (q.v.). The phenomena of animal magnetism, electrobiology, hypnotism, mesmerism, and odylic force are practically the same. Within the last few years they have been scientifically investigated, notably by Dr. Carpenter in England and by Prof. Weinhold and Dr. Heidenhain on the Continent. The chief phenomena are a hypnotic state induced by the patient gazing fixedly at some bright object, or by passes made by the operator; muscular rigidity, sometimes to such an extent as to admit of the body resting supported only by the head and heels on two chairs, insensibility to pain, and perverted sensation, as exhibited in a slightly hypnotized patient drinking water and imagining it to be delicious wine or nauseous medicine at the will of the operator. 1. *Jewish Hist. & Faith:* The Anointed One; a certain Personage or Being regarding whom Daniel prophesied. He was called "the Prince," was apparently identified with the "most Holy" [One], was to appear at the end of "seven weeks and three score and two weeks" from the issue of the decree to rebuild Jerusalem, was in sixty-two weeks to be "cut off but not for himself," after which Jerusalem was to be destroyed by foreign invaders (Dan. ix. 25, 26). In Psalm ii. 2, the Lord and his anointed might be rendered the Lord and his Messiah. Three classes of men were officially anointed under the Jewish dispensation: (1) Priests, and especially high priests (Exod. xxviii. 41; Levit. iv. 3, 5, 16; Num. xxxv. 25: (2) Kings (1 Sam. ix. 16, xvi. 3; 2 Sam. xii. 7; 1 Kings i. 34, xix. 16): (3) Prophets; Elijah, before his translation, was directed to anoint Elisha, his successor (1 Kings xix. 16; cf. also Isaiah lxi. 1–3). Presumably then the Messiah spoken of by Daniel would discharge priestly, kingly, or prophetic functions, or two out of the three, or all the three. The name "the Prince" would suggest that kingly functions would be specially prominent. During the later and more calamitous period of the old Hebrew monarchy, there were increasingly ardent desires for the coming of the Messiah, who was regarded chiefly as a deliverer from foreign oppressors. In Jewish belief that advent is still to be expected.

2. *Christian Hist. & Faith:* The Anointed One is in Greek Χριστός (*Christos*), from χρίω (*chriō*) = to anoint. So throughly are the words identified, that the Heb. מָשִׁיחַ (*mashiachh*), which occurs thirty-nine times in the Old Testament, is in every case rendered in the Septuagint χριστός (*christos*). When Jesus of Nazareth consented to accept the appellation "the Christ," or simply "Christ," as his official designation, he claimed to be the Messiah of Daniel's prophecy (Matt. i. 16, xvi. 20, xxvi. 63; Mark viii. 29, xiv. 61; Luke iii. 15, ix. 20, xxii. 67; John i. 41, vi. 69, &c.). All Christendom has acknowledged the claim. [CHRIST.]

mĕt-a-jĕn'-ĕ-sĭs, *s.* [Pref. *meta-*, and Eng., &c. *genesis* (q.v.).]

Biol.: A term introduced by Prof. Owen, and defined by him as—

"The changes of form which the representative of a species of animal or plant undergoes in passing by a series of successively generated individuals from the egg to the mature or imago state. It is distinguished from metamorphosis, in which those changes are undergone in the same individual."—*Comp. Anat. Invert. Anim.* (Glossary.)

To show the distinction between metamorphosis and metagenesis, he carefully traces the course of development of the Lernæan parasite of the perch, and points out that metamorphosis "is attended with the casting-off of a certain proportion of the precedent individual," or the new animal may be said to creep out from the old; while in metagenesis

"the outer case and all that gave form and character to the precedent individual perish and are cast off; they are not changed into the corresponding parts of the new individual. These are due to a new and distinct developmental process, rendered possible through the retention of a certain proportion of the unchanged germ-cells. The process is essentially the same as that which develops the cercariform larva of the Distoma within the gregariniform one, or the external bud from the Hydra, or the internal bud from the Aphis. It is a slightly modified parthenogenesis; and the phases by which the locomotive anellidous larva of the Lernæa passes through the entomostracous stage before retrograding to the final condition of the oviparous, limbless, bloated, and rooted parasite, are much more than those of a *metagenesis* than a metamorphosis."—*Owen, Anat. Invert. Anim.*, lect. xiii.

Herbert Spencer (*Principles of Biology*, vol. i., ch. vii.), adopts the term as one of the three divisions of his agamogenesis, aud divides it into (I) external, where "the new individuals bud out, not from any specialized reproductive organs, but from unspecialized parts of the parent;" aud (2) internal, as in the case of

the "King's-yellow worm" produced in the egg of Distoma. It increases in size, and the greater part of its inner substance is transformed into Cercariæ (the larvæ of Distoma), until at length it becomes little more than a living sac, full of living offspring. In *Distoma pacifica*, the brood arising by internal gemmation are of the same form as their parent, themselves producing Cercariæ after the same manner at a subsequent period.

¶ (1) *Bimetallism:*

Currency: Loosely, the concurrent coinage of two metals into standard money; more exactly, the legal obligation of a national mint to coin both gold and silver at a fixed ratio between the two metals, coupled with a law giving such coins equal monetary power without discrimination as to the metal of which they are composed; in either sense popularly termed a *double standard.* This system was first introduced in 1803 by the French law of 7 Germinal, year XI., which enacted that 5 grammes weight of silver, nine-tenths fine, should be coined into the monetary unit of one franc. The kilogramme of standard silver was therefore coined into 200 francs. The same law provided for the kilogramme of standard gold, nine-tenths fine, being coined into 155 pieces of 20 francs, equal to 3,100 francs, or at the rate of 5 grammes weight of standard gold into $15\frac{1}{2}$ francs, thus establishing the mint ratio of $15\frac{1}{2}$ to 1 (*i.e.*, $\frac{31\,0}{200}$, which still remains the proportionate weight and comparative mint value, in France, of any given sum in French-coined silver and gold respectively. That bimetallism provides an actual double standard is scientifically untrue, since the natural law of supply and demand renders a continuous parity between any two commodities at a fixed ratio not only unlikely but almost impossible. In actual operation, the plan resolves itself into what may be called alternative monometallism; that is to say, of two metals legally employed on equal terms as a basis of a currency, the cheaper (at the established ratio) will be the actual standard, supplanting and practically nullifying the other and dearer standard until such time as the natural laws of commodity shall reverse the conditions or reëstablish between the metals a natural parity in the exchanges—the latter being a rare occurrence. Two separate and different standards for the same thing is a logically absurd proposition, but a legalized choice between two nominal standards is quite reasonable. This bimetallism actually contemplates. [MONEY, ¶; VALUE, *s.*, ¶.]

Geol.: The term—first proposed by Lyell in 1833, and since universally adopted—for the stratified crystalline rocks—that is, rocks which have been presumably laid down originally by the action of water, and then transformed by fire, chemical agency, pressure, or all combined. Metamorphic action is divided into local—affecting only small portions of rock, or small areas, and regional—affecting rocks over considerable regions. The metamorphic rocks constitute one of the five great classes of rocks. The chief are gneiss, eurite, horublende schist, serpentine, actinolite schist, mica-schist or micaceous schist, clay slate, argillaceous schist or argillite, chlorite schist, quartzite or quartz rock, and crystalline or metamorphic limestone. Besides these which were probably at first sedimentary, the other classes of rocks have in places undergone metamorphosis.

II. *Technically*:

1. *Bot.*: A change, especially of an abnormal character, in an organ. It may be progressive or retrogressive. Calyx, corolla, stamens, and pistils are all transformed leaves. This interesting discovery—foreshadowed by Jung or Jungius in 1678, Linnæus in 1763, and Caspar Friedrich Wolf in 1759—was first clearly enunciated by Goethe in 1790. In the Peony, *Pæonia albiflora*, a whole series of connecting links may be observed between the form of the lower leaves and that of the petals, the higher leaves and then the bracts being the connecting links. In the White Water-lily, *Nymphæa alba*, a similar gradation may be observed between petals and stamens. In the double-flowered cherry the pistils will sometimes be found to have reverted to the appearance of leaves.

2. *Entom.*: A series of transformations which insects undergo in their progress from the egg to full maturity. Macleay divided metamorphosis into obtect, as in Lepidoptera and Trichoptera; coarctate, as in Hymenoptera and Diptera; incomplete, as in Coleoptera and Aptera; and semi-complete, as in Orthoptera and Hemiptera. Now only two divisions are generally recognized—viz., perfect when the pupa is inactive, and imperfect when it is the reverse. In the Lepidoptera (Butterflies and Moths), the metamorphosis is complete. They may stand as types in this respect of the whole class. The animal emerges from the egg as a caterpillar with six legs, which will become the future legs of the perfect insect, and some prolegs, destined to disappear. Its function in the larval state is to eat, which it does with such vigour and persistency that its skin, time after time, becomes too small to contain its expanding body, and has to be renewed. When the caterpillar is full grown it ceases to eat, becomes quiescent, and has developed around it a horny case, in which it lies like a corpse in its coffin. In due time it makes its way out of its chrysalis as a fully-developed winged animal. There are analogous changes more or less complete in the other orders.

3. *Zool.*: Metamorphosis takes place in many other animals besides insects. Thus a barnacle (Lepas) or an acorn-shell (Balanus) is at first a free and swimming creature, which ultimately becomes sedentary and attached to rocks or ships' bottoms. Metamorphosis exists also in Annelids, in Molluscs, in Medusas, &c. [METAGENESIS.]

mĕt-ą-phўş'-ĭcs, mĕt-ą-phўş'-ĭc, * mĕt-ą-phўş'-ĭcks, *s.* [METAPHYSIC.]

1. *Hist. & Philos.*: A term popularly employed to denote a science dealing with subjects incapable of being dealt with by physical research. Broadly viewed, the Aristotelian metaphysic was the science of the first principles of being, the science of the first principles of knowing, and the science of God, as the beginning and ending of all things; and these three were the foundation of scholastic philosophy, which found its highest expression in Thomas Aquinas (circ. 1225–1274). Metaphysics "is made by him conversant with being as such and its modifications. In itself each *ens* is *res* and *unum*; in distinction from others it is *aliquid*; as in harmony with the action of the knowing faculties, it is *verum*; and as harmonizing with the will, it is *bonum*." The Roman metaphysic of the present day is, to a great extent, Thomist, and is divided into General, or Ontology, and Special, embracing Cosmology, Psychology, and Natural (as distinguished from Moral and Dogmatic) Theology. The Leibnitzo-Wolfian metaphysic is noteworthy for its rationalistic tendency. Its ontology treats of the existent in general; its rational psychology, of the soul as a simple non-extended substance; its cosmology, of the world as a whole; and its rational theology of the existence and attributes of God. The Metaphysic of Kant was rationalist. Sum-

marizing the remarks accompanying his notice of the course for 1765, Wallace says :

"In the course on Metaphysics the early lectures would deal with experiential Psychology, where, avoiding all mention of a soul, a reasoned account would be given of the facts or phenomena of the mental life. Going on next to the theory of living bodies (the Biology of the period), and thirdly to Cosmology, or the theory of the material world, he would come in the fourth place to Ontology, which expounds the general properties of things, and includes rational Psychology (where the idea of soul or spirit is brought in), and would terminate with rational Theology."—*Kant*, p. 131.

Sir William Hamilton (1788–1856) give the following definition :

"Science and Philosophy are conversant either about Mind or about Matter. The former of these is Philosophy properly so called. With the latter we have nothing to do, except in so far as it may enable us to throw light upon the former, for metaphysics, in whatever latitude the term be taken, is a science, or complement of sciences, exclusively occupied with mind."—*Lect. on Metaphysics*, i. 121.

Auguste Comte, the founder of the Positivist philosophy, excluded metaphysics from his system, substituting for it the teachings of positive science. One of the latest authorities on the subject, Prof. Ferrier of St. Andrews, says (*Institutes*, pp. 36, 37) :

"Metaphysic is the substitution of true Ideas—that is, of necessary truths of reason—in the place of the oversights of popular opinion and the errors of psychological sciences."

The three divisions of his philosophy—for he prefers that term to metaphysic—are, "(1) The Epistemology, or theory of knowledge; (2) the Agnoiology, or theory of ignorance, and (3) the Ontology, or theory of being."

2. *Pl.* : According to Prof. Huxley, the second and higher division of the animal kingdom, the first and lower being Protozoa. [Protozoon.] The whole of the metazoa may be regarded as modifications of one actual or ideal primitive type, which is a sac with a double cellular wall, enclosing a central cavity, and open at one end. This is what Haeckel terms a gastræa. The first change which takes place in the development of the embryo from the impregnated ovum is the division of the ovum, and the simplest form of division results in the formation of a spheroidal mass of blastomeres. The morula thus formed generally acquires a central cavity, and becomes a hollow vesicle, the wall of which is the blastoderm, the cells of which give rise to the histological elements of the adult body. Sexual reproduction always occurs, and very generally the male element has the form of filiform spermatozoa. The sponges are the lowest of the Metazoa, under which designation the Vertebrata are included, and those Invertebrata possessing a notochord, and having the trunk divided into segments in the adult state. 1. *Literally:* A luminous body appearing for a few moments in the sky, and then disappearing, exploding or descending to the earth; a shooting star. On any clear night an occasional meteor may be seen, but the most brilliant displays are confined to particular dates. A very notable one is on Nov. 13 or 14. In 1864, Prof. H. A. Newton, of Yale College, predicted a display in 1866, and determined the length of the meteoric cycle, the annual period, and the probable orbit round the sun of the November stream. The display which came on Nov. 13, 1866, was splendid. It was seen all over Europe, at the Cape of Good Hope, and elsewhere. About eight thousand meteors were counted at Greenwich, and it is supposed that another thousand may have escaped observation. They came from a radiant point 149° 12′ of right ascension, and 23° 1′ of north declination, between γ and ε Leonis, just north of the bright star Regulus. On an average, each meteor was visible about three seconds, and drew a cord of silver radiance from twenty to forty degrees in length. In Nov., 1867 and 1868, considerable star showers were seen in the United States. Similar displays have been seen in the Nov. of the years 902, 931, 934, 1002, 1101, 1202, 1366, 1533, 1602, 1698, 1799, 1832, and 1833. That of Nov. 12, 1799, was one of the finest. It was seen by Humboldt and Bonpland at Cumana, in South America. Prof. Adams places the more magnificent displays at intervals of thirty-three and a quarter years apart, and, if his theory be correct, the next will be due in 1899. It is believed that a ring of meteors revolves round the sun, portions of it very thickly studded with them, while at others they are only sparsely scattered. Every year the earth's orbit cuts through the ring, though only at intervals of about thirty-three years through the part where they are most crowded. The meteors themselves are of iron, which, striking the atmosphere of the approaching earth with planetary velocity, ignite and go to dust. Leverrier considers that in A.D. 127 the attraction of the planet Uranus brought them into their present orbit. Heis and Alexander Herschel recognise about a hundred other meteor systems; hence it has been found needful to distinguish them by names. The November meteors coming from the constellation Leo are called Leonids. The next in importance appear about August 10, and come from the constellation Perseus. They are therefore named Perseids. Of old they were called the Tears of St. Lawrence. They appear generally much earlier in the evening than the Leonids. In 1866 Prof. Alexander Herschel, son of Sir John Herschel, studying the August meteors with a spectroscope, found some of them to consist in large measure of sodium vapour, and to be "nothing else but soda flames." There are also Lyrids, Geminids, Orionids, Draconids, Aquariads, Andromedes, &c. Prof. Schiaparelli, of Milan, has shown that the orbits of particular comets often wonderfully coincide with those of meteoric rings. A small comet, called Temple's, invisible to the naked eye coincides with the orbit of the November meteors, and a large one, called Tuttle's comet, visible to the naked eye in 1862 with that of the Perseids.

¶ Viewing the term meteors as a generic word, the committee of the British Association on Luminous Meteors range under it what may be called the following species:

1. *Telescopic Meteors*, only rendered visible to the naked eye by the aid of telescopes.
2. *Shooting-stars*, visible to the naked eye, and comparable to the different apparent magnitudes of the fixed stars in brightness.
3. *Bolides* and *Fireballs*, or very luminous meteors, comparable in brilliancy to the planets Jupiter and Venus, and to the different phases of the moon, and sometimes even rivalling the sun by appearing with much splendour in broad daylight, the term *bolides* being usually applied to the smaller, and *fireballs* to the larger kinds.
4. *Detonating* or *"Aerolitic" Meteors*, fireballs which produce an audible explosion, like a distant cannon, a peal of thunder, or an earthquake's shock, by their concussion with the air, and which differ accordingly from the last (as "forked" lightning often does from distant and "sheet" lightning) only by the thunder-clap that not unfrequently reverberates from fireballs of the largest and brightest class; or, finally, as
5. *Stonefalls* and *Ironfalls* (the latter very rare occurrences), or the falls of meteorites, either singly or in a shower, it may be of many thousands of fragments, from a fireball, which, especially if seen in the daytime, when these occurrences are usually observed, is almost always a large meteor of the last-named description. (*Brit. Assoc. Report* (1878), p. 371.)

Church Hist. & Eccles.: One of the leading religious systems of English-speaking races. A religious society existed at Oxford in the year 1727, among the members of which were John and Charles Wesley and George Whitefield, young men studying for orders. They and their associates were half-derisively called the "Godly," or the "Sacramentarian Club" (because they went through a mocking crowd to communicate at St. Mary's), and, finally, Methodists, from the methodical way in which they performed their religious duties. John Wesley, the second son of the Rev. Samuel Wesley, was born at Epworth, in Lincolnshire, June 17, 1703. On Oct. 14, 1735, John and Charles Wesley sailed for Georgia as agents of the Society for the Propagation of the Gospel, but their mission was a failure. In 1736 Charles, and in 1738 John, returned to England. His friend George Whitefield had already on February 17, 1739, commenced open-air preaching near Bristol. Wesley followed at the same place; but, unlike Whitefield, organized his converts into societies, the first being formed in that year. The first meeting-house was built in Bristol in 1740; the Foundry in Moorfields, London, hired for a term of years, was fitted up as a preaching-house. In Wesley's absence, his schoolmaster, Thomas Maxfield, presumed to preach in the Foundry. Wesley hastened to London to silence him, but, by his mother's advice, he was persuaded to listen before he acted, was convinced that she was right, forbore to interfere, and consented to the rise of an order of lay preachers. In 1741, Wesley and Whitefield ceased to act together, their views on the decrees of God differing, Wesley being Arminian and Whitefield Calvinistic. Though Whitefield had not the organizing gift of Wesley, his preaching laid the foundation of two denominations—Calvinistic Methodists (q.v.) and Lady Huntingdon's Connexion. [Huntingdon.] He died in America on Sept. 17, 1770. In 1744 the first conference was held; it was attended by six persons, all clergymen. At the conference held at Leeds in 1755, the separation between itinerant and local preachers was made broader: the former were to be supported by the contributions of the societies; the latter to support themselves by their ordinary callings, preaching during hours of leisure. By 1767 there were thirty-two of the former and some hundreds of the latter; in 1791 the former numbered 312.

Charles Wesley, who had rendered the Methodists, and the English Churches generally, great service by his hymns, died in 1788, and John, at the age of nearly eighty-eight, on March 2, 1791.

In 1784 John Wesley had executed a deed poll in Chancery, which, reserving his rights and those of his brother, provided that on his death his place should be supplied by a permanent body of one hundred ministers, meeting at the conference, and called the Legal Hundred. They still constitute the supreme governing body of the Wesleyan Methodists. When it meets, it fills up by co-optation all vacancies which may have arisen during the year. John Wesley strongly felt that a minister should not administer the sacraments unless he were duly ordained. In the absence of a bishop, he would sanction ordination by presbyters, and had himself, in 1784, ordained two ministers for America. With all his influence, he found it difficult to repress the desire of the preachers to administer the sacraments, and in 1795 the liberty was conceded wherever a congregation sought it for their pastor. In 1797 a schism took place, originating the Methodist New Connexion (q.v.). [New, ¶.] In 1810 arose the Primitive Methodists (q.v.); in 1815, the Bible Christians (q.v.); in 1828, the Protestant Methodists; in 1834, the Wesleyan Methodist Association; in 1849, the Wesleyan Reform Association (q.v.), the last three now combined together and called the United Methodist Free Churches. The annual conference, during the consideration of spiritual questions, is composed of ministers only.

The Methodist Church in the United States, organized under Episcopal government, is a powerful body. At the end of the Revolutionary War it numbered 43 preachers and 13,740 members. It now has a membership of nearly 5,000,000, with more than 25,000 ministers. In addition to the Methodist Episcopal branches there are several small bodies of Methodists, named the United Brethren, the American Wesleyan, the Independent, the Primitive Methodists, &c.

The ten-millionth part of this quadrantal arc was adopted to be the linear measuring unit, whicb they called "mètre," applying it equally to superficial and solid measures, taking for the uuit of the former the square of the decuple, and for that of the latter the cube of the tenth part of tbe metre. They cbose also for the measuring unit of weight tbe quantity of distilled water equal in bulk to the same cube at a certain temperature. They also decided tbat tbe multiples and sub-multiples of eacb kind of measure, whether of weigbt, capacity, surface, or length, sball bo always taken in the decimal or decuple proportion, as the most simple, natural, and easy for calculation. Tbe metre is the basis of calculation; from it are derived: Of area: the *are,* 1 square decamctre; of capacity: tbe *litre,* 1 cubic decimetre; of weight: the *gramme,* 1 cubic centimetre of water. The names of the graduations below the unit are formed from the Latin, and above the uuit are formed from the Greek.

The invention of the instrument is claimed for John Maelzel, by whom it was patented in England on Dec. 5, 1815, but his claim to the invention rests on very doubtful authority; the principle he worked upon was that which had beeu carried out nearly 100 years before he was born. ¶ A metropolitan was at first one whose episcopal functions were extended over a metropolis and the country of which it was the seat of government. That metropolis, once the chief city of an independent state, might have sunk into a provincial capital—*i.e.*, the capital of a province of the Roman Empire. When the bishops of that province met in a provincial council, the metropolitan presided. mĕz'-zō-tint, mĕz-zō-tĭn'-tō (mĕz as mĕtz), *s.* [Ital. *mezzo* = half, and *tinto* = tint (q.v.).] A process of engraving on copper. The smooth plate is abraded with a roughened file-like tool, and myriads of tiny points are raised over the surface of the plate. These points catch and hold the ink, and an impression taken from a plate in this condition would give a soft velvety mass of black without variety of light and shade. A burnisher is next used to get rid of the raised points where half tones and lights are wanted. Sometimes where very brilliant high lights are required, they are cut away so as to ensure a smooth surface of copper. By means of this burnishing process, all gradations of light and shade are obtained from the white of the smooth copper to the black of the roughened plate. The process dates from about the middle of the seventeenth century.

mī'-că, *s.* [Lat. *mica* = a crumb; Fr. & Sp. *mica.* Not related to Lat. *mico* = to shine, to glimmer.]
Min.: A name originally given to the shining, scaly constituent of many rocks and earths. The great diversity of chemical composition and other characters led to its division into several species, which were supposed to have distinctive crystallographic and chemical characters. The word is now used to designate a group of minerals having certain characters in common, the most important of which is the eminently perfect basal cleavage, which affords very thin, tough, and shining laminæ. The species hitherto distinguished are, Phlogopite, Lepidolite and Cryophyllite (regarded as orthorhombic); Biotite (hexagonal); Lepidomelane (hexagonal?); Astrophyllite and Muscovite (orthorhombic, but with monoclinic habit). Tschermak, who has recently optically investigated this difficult group of minerals, refers them all to the monoclinic system, his examinations showing that the axis of elasticity is inclined a few degrees to the normal to the plane of cleavage. Bauer confirms these results. Tschermak divides the micas into two groups: those which are characterized by having the optic-axial plane perpendicular to the plane of symmetry, which includes Anomite, Lepidolite, Muscovite, Paragonite, and Margarite; and those which have the optic-axial plane parallel to the plane of symmetry, and which embraces Meroxene, Lepidomelane, Phlogopite, and Zinnwaldite. Rammelsberg, as the result of a chemical investigation of this group, divides them into the alkali micas, magnesium mica, iron-magnesium mica, lithium-iron mica, and barium mica. The species and varieties belonging to this important group are, Anomite, Astrophyllite, Biotite, Cryophyllite, Enchlorite, Fuchsite, Haughtonite, Lepidolite, Lepidomelane, Margarite, Margarodite, Meroxene, Museovite, Oellacherite, Paragonite, Phengite, Phlogopite, Siderophyllite, and Zinnwaldite. Geol. & Petrol.: A slaty metamorphic rock composed of mica and quartz. The mica is usually muscovite (potash mica), though sometimes it is biolite (magnesian mica). The rock usually splits along the micaceous folia. Occasionally mica seems to constitute the whole mass of the rock. Next to gneiss, mica-schist is the most common metamorphic rock. It sometimes passes gradually into others of the same series. The addition of felspar making it become gneiss, and a decrease in the amount of quartz with an increase of chlorite makes it chlorite schist. Sorby has seen traces of ripple rocks. Various imbedded minerals occur, as quartz, garnet, &c.

Mī'-cah, *s.* [Heb. מִיכָה (*Mikhah*), for מִיכָיְהוּ (*Mikhayahu*) = Who is like Jehovah? Sept. Gr. Μιχαίας (*Michaias*).]

1. *Scrip. Biog.:* Various persons with their names spelled Micah, Michah (1 Chron. xxiv. 24, 25), or Micha (2 Sam. ix. 12), are mentioned in the Old Testament. Specially: (1) A priest (Judges xvii., xviii.) believed to have been a descendant of Moses, written Manasseh (xviii. 30). (2) The prophet called Micah the Morasthite, perhaps to distinguish him from Micaiah, the son of Imlah, who lived in the reign of Ahab. Morasthite means of Moresheth, probably Moresheth-gath (Micah i. 14). Scarcely anything is known of him, except what may be gathered from his prophecies.

2. *Old Test. Canon:* The sixth in order of the "minor prophets," *i.e.*, of the minor prophetic books. The title states that "the word of the Lord came to Micah the Morasthite in the days of Jotham, Ahaz, and Hezekiah, kings of Judah." The visions seen, however, were concerning Samaria and Jerusalem, the capital of the ten tribes, it will be observed, standing before that of the two (i. 1). Jeremiah attributes at least the prophecy in Micah iii. 12 to the reign of Hezekiah (Jer. xxvi. 18, 19). The corruptions of the ten tribes and of the two are denounced; and the prophet foretells the destruction of both Samaria and Jerusalem (i. 5, 6; iii. 8–12); the captivity in Babylon (iv. 10); the world-wide spiritual influence to be ultimately exercised by Jerusalem and Zion, and the rise of a ruler to be born in Bethlehem, "whose goings forth have been from of old, from everlasting" (v. 1, 2). The most natural division of the book is into three sections, ch. i.–ii., iii.–v., and vi.–vii., each beginning with a formula calling on the people to hear (i. 2, iii. 1, vi. 1). Passages in Micah resemble others in Isaiah (cf. Micah iv. 1–5 with Isa. ii. 1–5). Micah is quoted or alluded to in Matt. ii. 5, 6, x. 35, 36; Mark xiii. 12; Luke xii. 53; John vii. 42. The canonical authority of the book has never been doubted.

If the thread of a micrometer-screw in an instrument has 50 threads to an inch, and carries a pointer which traverses a graduated circle divided into 20 equal parts, the revolution of the micrometer-screw for a distance equal to one of the divisions will move the object to which the screw is attached $\frac{1}{1000}$ of an inch; that is, 20 × 50 = 1,000.

It is variously constructed, the most usual method being with a piece of charcoal held loosely between two other pieces in such a manner that it is affected by the slightest vibrations conveyed to it by the air or any other medium. The two external pieces are placed in connection with a telephone, and, when the ear is placed at the ear-piece of the telephone, the slightest sound on the wooden support of the microphone is so magnified that even the tread of a fly appears as loud as the tramp of a horse. [Telephone.]

mī'-crō-scōpe, *s.* [Gr. μικρός (*mikros*) = small, and σκοπέω (*skopeō*) = to see, to observe; Fr. *microscope;* Ital. & Sp. *microscopo.*]

Optics: An optical instrument by which objects are so magnified that details invisible or indistinct to the naked eye are clearly seen. In a simple microscope the magnifying power is interposed directly between the eye and the object, in the manuer of a magnifying glass; and though the power may consist of several lenses, they combine as one; a triple set of which either lens can be used singly, or any two, or all in combination, is usual. In a compound microscope, an aerial magnified image of the object is projected by one leus in the manner of a magic lantern, and this image is looked at and further magnified by a secoud power as in the simple microscope. The first lens is called the object-glass (q.v.), or objective; the second the ocular or eye-piece. The most important by far is the object-glass. The shorter its focus the larger is the image produced. Of late years glasses have been produced of extraordinary power. The highest power yet made is of $\frac{1}{175}$ inch focus; this tiuy object consists of many lenses so combined as to give good definition, and under such a power the small circular section across a human hair would occupy many times the field of view. The eye-pieces are also made of various powers. The instrument further requires a stage on which the objects can be placed aud held; underneath which must be a mirror for directing the light to the object when viewed transparently. In using high powers, fine mechanical movements are employed to adjust the object; aud the best instruments have underneath a finely-adjustable sub-stage, for the use of various illuminating apparatus. An instrument which presents an image to only one eye is called a monocular microscope; but there are several methods of dividing by prisms the pencil of rays from the objective iuto two sets, which diverge to eye-pieces so placed, that both eyes can be used: such an instrument is called a binocular microscope. In all the usual forms of microscope, the image of the object appears inverted, and for most objects this is of no consequence. For dissecting under high powere this is, however, inconvenient; and for such and other purposes instruments are constructed which, by prisms or lenses, re-invert or right the object, which thus appears in its true position: such are called erectiug microscopes. In the solar microscope a lens condenses the sun's rays upon an object, which is thus so intensely illuminated that the objective can project a greatly enlarged image upon a white screen. In the electric microscope the rays from the electric light are similarly used, and in this way microscopic photographs of long messages, on tiny slips of collodion, were enlarged and transcribed during the siege of Paris in 1870. The oxy-hydrogen microscope similarly employs the light from lime made incandescent by the oxy-hydrogen flame. This is a far cheaper and more convenient light than the former, but of much less power; very lately, however, this form of microscope has been so greatly improved that magnifications of 1,200 to 2,000 diameters can be obtained with it.

"To the performance of every muscular motion, in greater animals at least, there are not fewer distinct parts concerned than many millions of millions and these visible through a *microscope.*"—*Ray: On the Creation,* pt. i.

1. The act of migrating, or removing from one place of residence to another, especially from one country or state to another; change of abode or residence.

II. *Technically:*

1. *Zool., Ornith., &c.:* A term applied to the periodical or irregular movements of all animals, especially to those of birds and fishes, for although the movements of some mammals correspond in some degree to those of birds, they are rather incursions than true migrations. In all the temperate parts of the globe there are many genera and species of birds which reside only a part of the year, arriving and leaving at tolerably fixed epochs. The fieldfare, red-wing, snow-bunting, and numerous ducks and waders visit England in the winter; and in the summer the cuckoo, the swifts and swallows, and numerous warblers appear, build their nests and rear their young, and then depart. Most of the birds that spend their spring and summer in our Northern States, pass the winter in the Gulf States, or still further south, while our winter visitants pass the summer in Canada or the Arctic region. It is the same with the birds of Europe and Asia. It is probable that what (for want of a better term) may be called "the instinct of migration" in such birds has arisen from the habit of wandering in search of food, greatly exaggerated by the powers of flight, and by the necessity for procuring a large amount of soft insect food for their unfledged young. Many sea-fishes migrate to a limited extent for the purpose of depositing their spawn in favourable situations. (*Wallace: Geog. Dist. Animals*, i. 10–34.)

2. *Bot.:* Many seeds have downy or feathery appendages which when wind blows influence their motion through the air; others are floated down rivers to alluvial sands near their mouths; the ocean may cast them on distant shores, or regions, now disconnected, may at a former geological period have been united. Their seeds may have been transported say from the Arctic circle to the tops of British highland hills, or they may have been eaten by birds, and, remaining undigested, have been voided at a distance from their original locality.

mī'-grą-tŏr-ў, *a.* [As if from a Lat. *migratorius*, from *migratus*, pa. par. of *migro* = to migrate (q.v.); Fr. *migratoire;* Ital. & Sp. *migratorio.*]

2. Wandering in habits; roving, nomadic, unsettled: as, To lead a *migratory* life.

3. Pertaining or disposed to migration.

"This purpose is sometimes carried on by a sort of *migratory* instinct, sometimes by the spirit of conquest."—*Burke: Abridg. of Eng. Hist.*, bk. ii., ch. ii.

II. *Zool., Ornith., &c.:* A term applied to animals, and more especially to birds, which reside in their ordinary habitat only during a period of the year, migrating at certain seasons to other countries where the temperature and surroundings are more in consonance with their general habits.

"The same species is often sedentary in one part of Europe, and *migratory* in another."—*Wallace: Geog. Dist. Animals*, i. 20.

migratory-cells, *s. pl.* A term applied under certain circumstances to the colourless corpuscles of the blood.

"By means of the amœboid movement of their protoplasm, the pale corpuscles under some circumstances possess the power of wandering or emigrating from the blood-vessels, penetrating between the elements of their coats, and in this manner they find their way into the interstices of the tissues, and hence into the commencements of the lymphatics. Cells like these, which appear to be wandering independently in the tissues, and particularly in the connective tissue, are known as *migratory* cells."—*Quain: Anatomy* (1882), ii., p. 30.

II. *Technically:*

1. *Vegetable Pathol.:* Morbid appearances produced upon plants by the ravages of parasitical fungi or other cause, or the parasitical fungus itself which produces the morbid appearance. Such fungi are always minute, and sometimes microscopic. Different genera and species attack different plants. Thus, wheat mildew is *Puccinia graminis; P. coronata* also attacks cereals. Another species injuring wheat is the Bunt or Pepperbrand, *Tilletia caries. Ræstelia coronata* attacks the ash, *R. lacerata* the hawthorn, and R. *cancellata* the pear. These three are sometimes placed in the genus Æcidium. *Oidium Tuckeri* constitutes the true mildew. *Oidium fructigenum* forms little concentric tufts on pears, apples, &c. These may be only early stages of some other fungus. Erineum, a pseudo-genus of Fungals is now kuown to be only a diseased state of the plants on which it appears; *Erineum aureum* or *Taphria aurea* occurs on poplar leaves. All the foregoing are parasites which attack the plants internally, and then force their way to the surface. Other mildews are produced by fungi which grow on the surface of plants, as *Cylindrosporum concentricum* on the cabbage. *Erysiphe* (*Sphærotheca*) *pannosa* is the Rose mildew; *E. pannosa* the Hop mildew. These fungi, growing on the surface of leaves, fruits, &c., do uot establish themselves till the plant on which they grow has become unhealthy from other causes. [Bunt, Eroot, Rust, Smut.]

2. The constitutional force of England, first formed A.D. 1285. Raised originally by the Lords-lieutenants of counties, and considered a counterpoise to the standing army. Recruited by compulsory service by ballot, a law which is still in existence though not put in force. It was permanently embodied from 1792 to 1803, during the threat of French invasion; but it was afterwards considerably reduced, until 1852, when 80,000 men were raised by voluntary enlistment. In the United States the Militia is not a national force, as in England, but a state organization, and is regulated by State laws. Yet the militia is, to a certain extent, subject to Congressional regulation, and under stress of circumstances is required to do duty for the general government. The experience of the Civil War taught the authorities of this country the value of a well-organized militia, and since then much more attention has been paid than formerly to organization and drilling of state volunteer forces. By the laws of the United States all able-bodied male citizens between the ages of 18 and 45 years, except such as are exempted by state laws, are held as subject to military duty. The total number of citizens belonging to militia organizations is limited by law. In the large state of New York the legal limit is 20,000, and in the whole country the militia numbers but a little over 100,000 men, less than one-fifth of one per cent. of the population. The militia has proved very useful on several occasions in recent years in suppressing violence arising from strikes.

1. & 2. In the same sense as **II. 1, 2.**

3. The white juice of certain plants.

4. An emulsion, made by bruising seeds: as, the *milk* of almonds.

II. *Technically:*

1. *Food, &c.:* The fluid secreted by all female mammals for the nourishment of their young. As an alimentary substance, it may be regarded as a perfect food. It consists essentially of a solution of sugar, albuminous and saline matter, and holds in suspension a certain proportion of fat in the form of very minute globules. The same constituents are found in the milk of all the mammals, but they differ considerably in the proportion in which they are present in each kind. Mare's milk contains a larger proportion of sugar, while that of the ewe is very much richer in albuminous and fatty constituents, the milk of the cow having its composition more evenly adjusted. The non-fatty solids of cow's milk, which consist of casein, albumin, sugar, and mineral salts, vary from about 8 to 11 per cent., and the fat from 2 to 7 per cent.; 9 parts of the non-fatty solids consist on the average of 3 parts of casein, 1 of albumin, 4·2 of milk sugar, and ·8 of mineral salts. The mineral matter consists chiefly of phosphates of lime and potash, with a little chloride of sodium. Milk spontaneously ferments, the sugar being converted into lactic acid, alcohol, and carbonic acid gas. When an artificial ferment has been used, a larger proportion of alcohol is generated, and the milk is converted into a product to which the name of koumiss has been given. The chief adulterant added to milk is water; but sugar, carbonate of soda, salt, salicylic acid, and borax are also occasionally used. These latter are obviously added, not to increase the quantity of the milk, but to cover the addition of water or in order to prevent the milk turning sour.

¶ Condensed milk consists of cow's or goat's milk which has been evaporated by the aid of steam pipes or a vacuum pan to one-fourth of its volume, refined sugar being added during the boiling in the proportion of 1¼ lb. in the quart of condensed milk produced. It is also prepared without sugar, but its keeping properties are much less than the sweetened article. Both kinds form a wholesome article of food.

2. *Human Physiol.:* Milk is the secretion of the mammary glands, whose activity begins at delivery, and continues for a period of nine months as a rule, but, if encouraged, may persist for a longer time. The fluid secreted contains all that is requisite for the nourishment and the development of the child. It contains 90 per cent. of water and 10 per cent. of solids (casein, fat, sugar, and a trace of salts). The first milk secreted is colostrum; it acts as a natural purgative to the child. That the mind exerts an influence both on the quantity and quality of secretion is certain. Violent emotions, as fear, rage, &c., render it unwholesome.

mĭl-lĕn'-nĭ-ŭm, *s.* [Lat. = a period of a thousand years, from *mille* = a thousand, and *annus* = a year.]

1. *Script.:* A period of a thousand years, during which Satan shall be confined to the bottomless pit, having first been bound by an angel with a great chain (Rev. xx. 1-3), whilst the souls of those who have been "beheaded for the witness of Jesus," and have not worshipped the beast or his image, or received his mark upon their foreheads or their hands, shall live and reign with Christ for a thousand years (Rev. xx. 1-6).

2. *Church Hist.:* During the first three centuries, when Christians were at intervals in danger of martyrdom, and many actually suffered death, the millennium loomed largely before their minds: the second advent of Christ, interpreted literally, was considered to be pre-millennial, and the millennium to be a literal reign of him and the martyrs. The Christian fathers, Papias, Justin Martyr, and Irenæus, with the heretical Cerinthians, Marcionites, Montanists, and Melitians, held these views, as did Papias and Irenæus with rather extravagant accompaniments. Towards the end of the second century, Caius, a presbyter of Rome, led the way in opposing their millennial conceptions, and, in the third, Origen considered the millennium as consisting of spiritual delights to be enjoyed by souls raised to perfection in the world to come. Jerome also gave a spiritual interpretation to the passage in Revelation. On the triumph of Christianity over Paganism, in the fourth century, the view gradually arose that mil-

lennial glory had already begun. The persecuted Christians had risen, and were spiritually reigning with Jesus unseen. His visible reappearance would not be till the consummation of all things, when he would come to judge the world. From about the year 950 yet another opinion arose and gained extensive credence. The millennium, to be heralded by the coming of Jesus, began with his first advent, and was now about closing. Many landed proprietors, therefore, believed they should no longer require their estates, and might atone for their sins by giving them over to the church, the deed of bequest commencing with the words *Appropinquante mundi termino* (As the end of the world is approaching), and the estates were not returned when it was found that the world outlasted the year 1000. Two opinions are now held: one, that the advent of Christ will be pre-millennial, and that a literal reign of martyrs and saints shall take place with him on earth; the other is, that the millennium will be brought on by the blessing of the Holy Spirit on the means employed for the conversion of the world, and that during the continuance of the promised years Jesus shall reign in the hearts of nearly all mankind, and shall not return visibly till he comes as Judge. Many interpreters, holding that in prophecy a day stands for a year, consider that the 1,260 days mentioned in Rev. xii. 6, &c., mean 1,260 years; yet they deem the 1,000 years to be literal years. The reason probably is that they are influenced by the Jewish tradition that the seventh thousand years from the creation of man shall be a Sabbatic thousand. Hugh Miller, who accepted the view that a prophetic day means a year, and, being a geologist, was not startled by very large numbers, considered the millennium to be 360,000 years.

Church Hist.: A follower of William Miller, an American pre-millennialist, who expected the immediate return of Jesus to reign upon the earth. Believing in the literal fulfilment of the prophecies, the Millerites asserted that the first judgment would take place in 1843. Subsequently other periods were named; and so firm was the faith of many that they disposed of all their worldly goods, provided themselves with "ascension robes," and waited with anxiety for the sounding of the last trumpet—the signal for their elevation. Many became insane through excitement and fear; others, finding that they were repeatedly disappointed, gave up their expectations, and the sect is nearly, if not quite, extinct." II. *Technically:*

1. *Zool.:* A term introduced by Mr. H. W. Bates to denote that "close external likeness which causes things really quite unlike to be mistaken for each other," which exists in the animal kingdom; but it should be borne in mind that there is no evidence that such mimicry is in the slightest degree voluntary. It may be regarded as the highest form of protective imitation or resemblance, or as that imitation or resemblance carried to its extreme limits. Mr. A. R. Wallace, who has brought together probably the largest collection of facts on this subject in the language (*Westminster Review*, July, 1867, pp. 1-43), says, that the phenomena of mimicry "have been shown to follow certain definite laws, which again all indicate their dependence on the more general law of the Survival of the Fittest." These laws are:—

(1) That in an overwhelming majority of cases of mimicry, the animals (or the groups) which resemble each other inhabit the same country, the same district, and in most cases are to be found together on the same spot.

(2) That these resemblances are not indiscriminate, but are limited to certain groups, which in every case are abundant in species and individuals, and can be often ascertained to have some special protection.

(3) That the species which resemble or mimic these dominant groups are comparatively less abundant in individuals, and are often very rare.

† 2. *Bot.:* The term is sometimes used of plants belonging to one order when in their general features they resemble species belonging to another order; as, for instance, certain foreign Euphorbiaceæ which bear a close superficial resemblance, though no affinity, to Cactaceæ. Professor Thiselton Dyer considers that there is no genuine mimicry in the Vegetable Kingdom, and terms the phenomenon now described Homoplasmy.

They are prickly herbs or shrubs, sometimes climbing; the leaves are bipinnate, and in some species sensitive. *Mimosa pudica* and *M. sensitiva* are the sensitive plants. The former is naturalized over India; the leaves are prescribed in piles and fistula. The bruised leaves of *M. rubicaulis* are applied to burns. Its root is charred for guupowder charcoal. II. *Psychol.:* In popular language mind is sometimes used as opposed to heart. Metaphysicians of the normal type, as a rule, contradistinguish it not from heart, but only from matter or body. They regard it as possessing emotions as well as intellectual powers; the former manifesting themselves in feeling, the latter in thought. Its existence is supposed to be established by the consciousness of the thinking individual, one notable school of psychology considering that it is not mind but external nature, the existence of which can be doubted. Till about the middle of the present century, mind was almost universally held to be possessed by none of the inferior animals; any apparent intelligence on their part was attributed to instinct. Herbert Spencer led the way in introducing new views on the subject. Availing himself not merely of the metaphysicians' chief mode of inquiry, his own consciousness, but of the facts accumulated by physicists and physiologists, he considered that in the case of each animal organism on earth, from the humble monad to man, there is an incessant interaction between the organism and its environment; a continuous adjustment of its internal to its external relations, the magnificent human understanding itself having resulted from their interaction or adjustment carried on through limitless ages. Following in the same direction, Mr. Darwin declared that the intellect and even the moral powers of man did not differ in kind, though very greatly in degree, from the rudiments of them exhibited by the lower animals. Not denying the latter instincts, he sought to establish that they had reason too, and that the superiority was the result chiefly of natural selection carried on

through cosmic periods of time. Both of these antagonistic schools of thought have their warm advocates.

The sulphurous waters are readily recognised by their disagreeable smell, and their property of tarnishing silver. Artificial mineral waters are frequently prepared in the laboratory, in imitation of the natural waters. The term mineral waters is also applied to artificial aërated waters, containing minute quantities of the salts of soda, potash, or lithia.

Nat. Hist.: A science treating of those natural inorganic products of the earth which possess definite physical and chemical characters. Its objects are to point out the various means to be adopted to ascertain the chemical composition and physical characters of inorganic substances, to determine their specific relations, to examine into their modes of occurrence, and their associations, with a view to establishing a systematic classification.

Simple minerals appear to have been known from very early times; but little or no progress, however, seems to have been made towards establishing any well-defined characters by which they could be recognised, till in 1669 Nicolaus Steno, a Dane, made the discovery that in crystals of quartz the angles of inclination of adjoining faces were constant, and that the number of faces and their grouping, notwithstanding variations in size, were always the same. In this year also the doubly-refracting property of Iceland Spar was observed. In 1672, quartz, which had been already designated by the Arabians crystal (clear ice), was shown by Robert Boyle to be heavier than an equal bulk of water by more than two to one, ice being bulk for bulk lighter than water. In 1772 Romé de l'Isle announced that the various shapes of crystals of the same product were intimately related. He showed that all the forms then known could be derived from one of six, which he called primitive forms. The Abbé Haüy in 1784 discovered that ten forms, including the six of de l'Isle, could be produced from various minerals by cleavage, and that these must be the true primitive forms. Haüy also propounded a theory of the structure of crystals, as to the relations of the secondary planes to those of the primitive form. Prof. Weiss, of Berlin (1809-1815), established fundamental lines, which he called axes, and to which he showed how all the primitive forms and secondary planes were related. Subsequently, though independently, Mohs (1820-1825) arrived at a division of crystals into four systems of crystallization which coincided with the four axial groups of Weiss. He also announced two other systems of crystallization, in consequence of more precise measurements being obtainable by the use of the reflective goniometer. The discovery by Malus in 1808 that a ray of ordinary light reflected at a certain angle from a glass plate possessed the same properties as that which emerged from Iceland Spar, enabled Brewster in 1819 to point out the intimate relation which existed between the cleavage form of a mineral and its action upon light. Brewster's classification of crystals on optical grounds agreed with that of Weiss and Mohs on geometrical ones, with the exception of two of the systems. The existence of the two additional systems of crystallization formerly announced by Mohs was, however, now established through their difference in optical characters from the other systems. Thus, six natural systems of crystallization are shown to include all possible crystal forms. The early attempts at classification were very vague, and were founded on supposed external differences, being divided into Earths, Stones, and Metals. Cronstedt's *Essay* (1758) was the first foreshadowing of a principle in a system of classification. The earths he classed as Calcareous, Siliceous, Argillaceous, and so on. Werner's last system, published in 1817, after his death, divided fossils (as minerals were then called) into four classes: viz., Earthy, Saline, Combustible, and Metallic. The system of Haüy (1801), like that of Werner, was a mixed one, but it was the first to direct attention to the importance of crystallographic form to a system of classification. In 1816 Berzelius published a system founded on the view that all chemical compounds consisted of an electro-positive and an electro-negative part, the former being the metal and the latter the acid. The discovery of isomorphism by Mitscherlich eventually rendered this system unworkable. In 1820 Mohs published his *Natural History System of Mineralogy*, in which the chemical composition was ignored, and the arrangement based on crystalline form (together with cleavage), hardness, and specific gravity. Mohs selected a suite of ten minerals, which he numbered in their order of increasing hardness, and called it the Scale of Hardness, so that that quality in a mineral could be designated by 3, 4·5, &c. This scale is still employed. [HARDNESS, II. 3.] The most perfect but mixed system is that published by Gustav Rose in 1852. It combines a chemical with a crystallographic arrangement. In this system natural groups of minerals, also the isomorphous, dimorphous, and trimorphous series, are brought together. It forms the basis of the systems of arrangement adopted in many large collections at the present time.

II. *Technically:*

1. *Hist.:* Dr. Birch places the discovery by the Egyptians of a mine of "mafka" (turquoise?) at Wady Magara, in the Peninsula of Sinai, in the fourth Memphite dynasty, between 3,000 and 2,000 B.C. Tubal Cain was an instructor of every artificer in brass (copper) and iron. It was said of Canaan, "out of whose hills thou mayest dig brass" (copper) (Deut. viii. 9), and Job refers to mining and metallurgy (xxviii. 1, 2, &c.). Herodotus says

that the Phœnicians had quite bored through a mountain in the Island of Thasos (vi. 46, 47). As early as the fourth century B.C. the silver mines of Laurium, in Attica, were worked by the Athenians. The Romans, when they held Spain, worked the quicksilver mines of Almaden. The Phœnicians of Gades (Cadiz), according to Strabo, traded with the Cassiterides (Scilly Islands) for tin and lead. During the Roman occupation of Britain, mining was carried on; it afterwards declined, and, when revived, it was chiefly in the hands of the Jews. In the reign of Queen Elizabeth, German miners were encouraged to settle in Britain, but soon native skill and industry rendered foreign aid unnecessary. About 1620, blasting rock by gunpowder commenced; in the next century the steam engine was introduced, and in 1815 there followed, for coal mines, the Davy lamp.

2. *Art & Operations:* Mining is prosecuted with the view of obtaining metallic ores for smelting, or other mineral deposits—as coal, rock-salt, diamonds, or other precious stones. Sometimes these are found on the surface, especially where cliffs are exposed; diamonds, gold-dust, &c., are sometimes obtainable from gravels overlying the more solid rocks, but, as a rule, mining operations cannot be prosecuted successfully except by sinking shafts and carrying on subterranean operations. Coal seams, which were originally horizontal, and even now may dip at only a low angle, are more easily reached than metallic lodes occurring in veins and fissures which, as a rule, descend at a high angle, or even vertically to the interior of the earth. [VEIN.] In both cases a shaft or shafts must be sunk, the roof, when undermined supported, and galleries run to reach or follow the course of the vein or seam.

3. *Law:* Mines belong to the owner in fee simple of the land, except gold and silver mines, which are the sovereign's by virtue of the royal prerogative. A tenant for life may work old mines on the land he occupies, but not open new ones. If a man follows a lode from his own land under that of his neighbour, he commits a trespass.

mining-companies, *s. pl.* The name given to the companies formed in Britain in 1825 for working mines in Mexico and South America, many of which came to a disastrous end. Afterwards it was extended to all companies of a similar kind.

mī'-ō-çēne, * meī'-ō-çēne, *s.* & *a.* [Gr. μείων (*meiōn*) = less, and καινός (*kainos*) = new, recent.]

A. *As substantive:*

Geology: A term introduced in 1835 by Sir Charles Lyell to designate the beds formerly called Middle Tertiary. The term Miocene denotes that only a minority of the shells belong to recent species. [Etym.] He founded it on the Faluns of France, which, according to M. Deshayes, have seventeen per cent. of their shell species recent. Subsequent discovery has slightly modified the number, especially as other beds than the Faluns have their own proportions of recent and fossil shells. Beyrich separated from it its lower portion, and, combining this with the Upper Eocene, founded a new division, the Oligocene (q.v.). The representatives of the Miocene are the Faluns of Touraine, those of Bordeaux, the freshwater strata of Gers, the Œningen beds, and the Marine Molasse of Switzerland, the Vienna and Mayence basins, the beds of the Superga, near Turin, the Miocene of the Western Territories in the United States, the Marine Miocene of India, Egypt, the West Indies, and Australia. The strata of the Siwalik Hills in India, formerly deemed Miocene, are now considered to be older Pliocene. Marine Miocene strata are sparingly displayed in the Atlantic States, but in the western parts of the United States freshwater deposits belonging to this geological age are abundant and widely distributed, and have yielded fossils of the most interesting character. They occupy the basis of great ancient lakes, which have gradually become silted up, and in which the remains of many animals were deposited by streams or otherwise. The shells of the Miocene show a somewhat warmer climate than that of the same localities now. Of vertebrates there are in the Eastern Hemisphere, *Dinotherium giganteum, Mastodon angustidens, Rhinoceros Schleiermacheri, Machairodus cultridens,* &c. Of quadrumana there are two genera, Pliopithecus, allied to the Gibbon, and Dryopithecus, allied to the Gorilla, to the Chimpanzee, and to Man. Among the American mammals are Mesohippus, Miohippus, akin to the Horse, Perchœrus and Elotherium (Pigs), and Hyænodon (a Carnivore). Abundant plants and insect remains have been found at Œningen, many of the former resembling modern North American plants more than those of Europe. Volcanic rocks of Mioceue age exist in Madeira, the Azores, and Australia. (*Lyell.*)

"A *miracle* I take to be a sensible operation, which, being above the comprehension of the spectator, and in his opinion contrary to the established course of nature, is taken by him to be divine."—*Locke: A Discourse of Miracles.*

¶ *The Controversy regarding miracles:*

Mental Phil., Theol., Church Hist., &c.: This was commenced by David Hume, who, in 1750, published, as the tenth section of his *Inquiry Concerning Human Understanding,* an essay headed, "Of Miracles," and asserted that:—

"A miracle is a violation of the laws of nature, and, as a firm and unalterable experience has established these laws, the proof against a miracle from the very nature of the fact is as entire as any argument from experience can possibly be imagined." Again, "That no testimony is sufficient to establish a miracle, unless the testimony be of such a kind that its falsehood would be more miraculous than the fact which it endeavours to establish, and, even in that case, there is a mutual destruction of arguments, and the superior only gives us an assurance suitable to that degree of force which remains after deducting the inferior." (*Works* (ed. 1809), pp. 120-126.)

Many replies were given on the Christian side to Hume's argument, one of the most noted being *A Dissertation on Miracles,* by George Campbell, D.D., F.R.S., Principal of Marischal College, Aberdeen. His contention (*Works* (ed. 1840), i. 29-39), in which he was supported long afterwards by Archbishop Whately, was, that there was a want of precision in Hume's use of the word experience. Whately showed that the word may have three meanings: personal experience, which would not be important for Hume's purpose; universal experience, regarding which it would be a *petitio principii* to assert that it was against the occurrence at any period of the world's history of miracles; or something intermediate between the two, viz., the experience of the generality, which is not enough to establish Hume's proposition. (*Whately: Logic* (Appendix I. viii.), *Experience.*) Some now hold the view that a miracle is not a violation of the laws of nature, but the operation of a higher law overriding that of a lower, as what may be termed the law of life suspends the chemical action of the gastric juices on the stomach itself during life, leaving them free to act at death.

mĭ-rage' (ge as zh), *s.* [Fr., from *mirer* = to look at, from Low Lat. *miro* = to behold, from Lat. *miror* = to wonder at.] An optical illusion by which images of distant objects are seen as if inverted, below the ground or raised in the atmosphere. The phenomenon is best observed in the Egyptian or other deserts, though occasionally seen elsewhere, and the inverted images so much resemble those made in water as to create the illusion that a lake is really near. The soldiers of Napoleon I., when in Egypt, were much tantalised by the mirage; and Monge, who accompanied the expedition, was the first to explain the illusion. The layers of air in contact with the heated soil are rarefied and expanded more than those immediately above them; a ray of light from an elevated object has to traverse strata of air less and less refracting, and the angle of incidence continually increases in amount till refraction gives place to internal reflection. According to the varying density of the several strata of air the mirage varies its character. In 1822, Captain Scoresby, sailing in the Polar regions, saw the mirage of a ship inverted in the air. He recognised it as his father's vessel, the *Fame,* and found afterwards that she was at the time thirty miles off. The mirage is sometimes reflected sideways. By this means the French coast has at times been made to appear in comparative proximity to our own. The mirage was known in ancient Jewish times; it is mentioned in Isaiah xxxv. 7, "And the parched ground shall become a pool and the thirsty land (Heb. שָׁרָב (*sharabh*) = the mirage) springs of water." The Fata Morgana, what sailors call the "loomings," the Flying Dutchman, the Enchanted Island, Cape Flyaway, &c., are all produced by the mirage.

I. *Ordinary Language :*

1. *Lit. :* A looking-glass, a speculum; any glass or polished substance which forms images by the reflection of the rays of light. Amongst the ancients, mirrors were made of various metals, as bronze, steel, silver, &c. Mirrors of polished metal are now called speculа. [SPECULUM.] The date of the invention of glass mirrors is not certainly known. From the account of Pliny, it would seem that they had been formerly made at the celebrated glass-houses of Sidon. The method of coating with tinfoil was known as early as the sixteenth century, at Murano, where it was first practised. Mirrors are either plane, concave, or convex. Plane mirrors represent objects of their natural size; concave mirrors, or those having a hollow surface, collect the rays, reflecting them to a focus in front of the mirror, and consequently enlarge the image of the object; convex mirrors disperse the rays, and therefore diminish the size of the image of the object.

7. A station or residence of missionaries; the missionaries connected with such station.

II. *Eccles. & Church History:*

1. *Singular:*

(1) The act of appointing to the cure of souls by a lawful superior. In the Roman Church the mission of a priest is derived from his bishop, who receives his mission from the Pope. There are two views as to mission in the Anglican Church: (1) that mission is conferred with consecratiou; and (2) that it is derived from the Crown. The former view is the one more geuerally held; though the supporters of the latter might effectively quote the words in which an Anglican bishop does homage to the sovereign for his see. Among non-episcopal denominations, mission is generally the act of a governing body.

(2) A quasi-parish. In countries not in communion with the Romau Church, priests are appointed to missions, and are removable at the will of the bishop. Since the establishment of the Roman hierarchy in England in 1850—known at that time as the "Papal Aggression"—the charge of certain important missions has conferred quasi-parochial rights. [MISSIONARY-RECTOR.]

(3) The holding of special services in any particular district with the view of stirring up the inhabitants to a more active spiritual life.

2. *Plural:*

(1) *Foreign Missions:* The injunction of Jesus which renders the duty of instituting missions imperative on the Christian Church is found in Matt. xxviii. 18–20 and Mark xvi. 15–18. The latter version of the command belongs to that portion of the last chapter of Mark which is of douhtful authenticity [MARK]. The Acts of the Apostles narrate the Pentecostal descent of the Holy Spirit accompanied by the gift of tongues, this miraculous endowment being evidently designed for missionary purposes (Acts ii.). They tell also how Peter and John (ii. 14, v. &c.), and subsequeutly Saul, or Paul, fulfilled the final command of Jesus (xiii.–xxviii). The revelation made to Peter that no man, Gentile or Jew, was commou or unclean, having removed the prejudice against the propagation of the gospel among the Gentiles (x.), St. Paul became their special apostle, while St. Peter

had for his chief charge the Jews. Tradition is probably correct in making every apostle a missionary, though details as to their several spheres are not trustworthy. In ante-Nicene times a series of zealous missiouaries laboured to spread the gospel. A certain tacit compromise with the prior faiths took place in various respects. The pagan festivals in particular showed intense tenacity of life, and as a rule it was found ueedful to give them a Christian varnish, and adopt them into the new religion. On the establishment of Christianity under Constantine in the fourth century, the civil power concerned itself about the spread of Christianity, and early in the ninth Charlemagne effected the conversion of the Saxous by a series of bloody wars. But genuine missionaries appeared. Thus, St. Patrick, who laboured in the fifth century, is called the "Apostle of Ireland;" Winifred, or Boniface, in the eighth century, the "Apostle of Germany." Christianity had reached Britain in Roman times, but the early British churches having been trampled out by the pagan Anglo-Saxons, Augustine and forty monks were sent to Canterbury. He became the "Apostle of England," and the first English primate. In the East, the Nestorians, from the eighth to the fourteenth centuries, prosecuted missions in Tartary and other parts of Asia, their zeal and devotion eliciting the admiration of Gibbon. The first Spaniards in America and the Portuguese in India made it a prominent object to spread Christianity, using, however, force for the purpose. In the sixteenth century, the order of Jesuits was established, to spread the Roman Catholic faith abroad as well as defend it at home. This order established missions in India, China, Japan, and South America. The greatest name was Francis Xavier (1506–1522), the "Apostle of the Indies." The zeal of the Jesuits stirred up the Dominicans, the Franciscans, and other orders. The Society de Propaganda Fide was instituted in 1622. The Protestant churches, whilst in conflict with Rome during the sixteenth and seventeeuth ceuturies, had little energy to spare for missions. In 1701 there arose the Society for the Propagation of the Gospel; about 1732 the Moravian brethren were very zealous for missions; in 1786 the Methodist Missionary Society, in 1792 the Baptist Missionary Society, in 1795 the Loudon Missionary Society, in 1796 the Glasgow, and in 1796 the Scottish Missionary Society; in 1799 the Church Missionary Society, in 1816 the Wesleyan Methodist Missionary Society, and in 1830 the Church of Scotland mission, and in 1843 that of the Free Church came into being, with several others. In the United States the missionary spirit has been equally active, and numerous Missionary Societies established, including the American Board of Missions (1810), the Burmese Mission, of the Baptists (1813), Missions of the Metbodist and Presbyterian Churches, &c. Iu 1889 the United States had 2127 missionaries in the field, Great Britain 2658. The success of this missionary work has not been very great, but there is some reason for encouragement and the work goes actively on.

(2) *Home Missions:* The taunt, "Why send so much money abroad when there are practically so many heathen at home?" helped to create home missions, which are now vigorously prosecuted in nearly every city of the United States, Great Britain, and elsewhere.

(3) *Jewish Missions:* The London Society for promoting Christianity among the Jews was founded in 1809; the Church of Scotland Mission to the Jews began in 1837; the Free Church mission iu 1843.

mitrailleur, *s.* [MITRAILLEUSE.]

mitrailleuse (as **mĭ-trā-yĕz'**), * **mitrail-leur** (as **mĭ-trā-yĕr'**), *s.* [Fr.] [MITRAILLE, *s.*]

Ord.: A weapon designed to fire a large number of cartridges in a short time. The name is given chiefly to those which are intended for use against men, firing, therefore, ordinary rifle bullets; but weapons of higher calibre, designed to discharge heavier projectiles against "material," are usually called "machine guns." In each instance, however, the weapon is a breechloader, and the shot is carried in a metal cartridge. The earliest forms were the French mitrailleuse and the Belgian Montigny mitrailleuse, both being composed of a number of barrels fastened in a group surrounded by a metal casing, the cartridges being contained in steel blocks, which are dropped successively into a "slot" or opening in the breech, and replaced, when discharged, by a fresh plate. The rate of firing of the Montigny was about 444 shots per minute, of the French piece 300 per minute. Those at present mostly in use are the Gatling (calibre, ·45-inch), with ten revolving barrels, and the light Nordenfeldt and Gardner patterns, with fixed barrels. These are fed from a drum containing cartridges, which is placed over a slot on the upper surface of the case covering the barrels. A scattering arrangement is usually fitted to the mitrailleuse, which causes the barrels to move from side to side while the piece is being discharged. The machine guns firing shot large enough to penetrate even thin iron plates are the Gatling (calibre, ·65-inch), the Nordenfeldt (calibre, 1-inch), and the Hotchkiss (calibre, 1·46-inch), and all these have fixed barrels without any scattering machinery. The first-mentioned fires 200 rounds a minute; the Nordenfeldt, 100 rounds in the same time. A six-pounder quick-firing shell gun of the Hotchkiss pattern is also under trial. The Nordenfeldt pattern consists of four barrels fastened side by side horizontally in a frame. It is fed from a carrier on top of the breech of the machine, which is filled by hand as it becomes empty. In the Hotchkiss gun the barrels, five in number, revolve, and in addition to solid cast-iron and steel shots, it fires explosive shells and canister, at the rate of 25 per minute. This weapon will penetrate ½-inch steel plates up to 2,000 yards range. The Maxim gun is of the same nature, but is not so liable to jam as the others.

Church Hist. (*Pl.*): A party in the Established Church of Scotland, which was dominant in its councils during the greater part of the eighteenth century and the early part of the nineteenth. It claimed to avoid extremes of doctrine, discipline, &c. The germ of moderatism began to develop soon after the Revolution Settlement of 1689; it was strengthened by the Act of Parliament, passed in 1712, reintroducing patronage, of which the moderate party ultimately became the warm defenders, and which they carried out so rigidly as sometimes to welcome the aid of military force to settle a presentee on a recalcitrant congregation. Some of them were men of literary culture, Principal Robertson, author of Charles V., the History of America, &c., being their leader from about 1751 to 1781. In 1796 the General Assembly, under moderate guidance, declined to take any steps in favour of Foreign Missions. From the time of the French Reign of Terror in 1793, the evangelical party, with which the moderates had long been in conflict, gained yearly an accession of strength, till, on May 27, 1834, the moderate party was defeated by 184 to 138 votes, on a motion giving a certain veto on the settlement of an unacceptable minister [VETO], and the moderate ascendency was temporarily overthrown. During the ten years' conflict, which ended in the disruption of 1843, the moderate party, in large measure, approved of the action of the law courts, and when the evangelical party seceded from the Church, they regained their old ascendency in the Scottish establishment. Since then their views have become considerably modified, and at their earnest request patronage (q.v.) has been abolished.

The Common Mole is about six inches in length (including the tail, rather more than an inch); the body cylindrical, muzzle long and pointed, eyes minute; no ear-conches; the fore-feet broad and fossorial, hind-feet long and narrow. Fur, black, soft, and velvety, with grayish tinge; but lighter shades often occur, and pure white individuals have been observed. The normal food of the mole is the earthworm. It is very voracious, and no kind of flesh seems to come amiss to it, but it will not touch vegetables. It takes readily to the water. The most common American moles belong to the genus *Sculops*, the shrew mole. The star-nosed mole, *Condylura*, is also common in the United States. [Golden-mole, Talpa, Water-mole.]

In the fore legs, there is a strong analogy with the moles, the tibiæ (the parts employed in digging) being flattened transversely to the axis of the body, and terminated by four finger-like processes. Lauds infested by the mole-cricket are recognizable by the colour of the vegetation, which is yellow and withered, from the roots being eaten off by the insect in its burrowing operations—not for food, as its diet is chiefly underground insects and worms. It flies occasionally in the evening, and its stridulation produces a note somewhat like that of the Goat-sucker. The larvæ, when first hatched, are white, and they are said to be three years in arriving at maturity.

Church Hist.: The tenets of Lewis Molina, a Spanish Jesuit, who taught in the Portuguese monastery of Evora, and in 1588 published a book on the union of grace and free will. It gave offence to the Dominicans and others, and a Congregation in Rome was appointed to examine the work. In their third Session they, on Jan. 16, 1598, thus stated its teaching.

"(1) A reason or ground of God's predestination is to be found in man's right use of his free will. (2) That the grace which God bestows to enable men to persevere in religion may become the gift of perseverance, it is necessary that they be foreseen as consenting and co-operating with the divine assurance offered them, which is a thing within their power. (3) There is a mediate prescience which is neither the free nor the natural knowledge of God, and by which He knows future contingent events before He forms His decree."

Frequent conferences subsequently took place between the Jesuits and the Dominicans on the disputed points. These meetings were called Congregations on the Aids, *i.e.*, on the aids of divine grace.

Zool.: An animal of the class Mollusca.

mŏl-lŭs'-cą, *s. pl.* [Neut. pl. of Lat. *molluscus* = soft, from *mollis* = soft.]

1. *Zool.:* According to Linnæus, an order of Vermes, distinct from Testacea, which immediately follows it. He placed under it a miscellaneous assemblage of genera which he described as naked, not included in a shell, furnished with limbs. They were: Actinia, Ascidia, Limax, Holothuria, Sepia, Aphrodita, Nereis, &c. (*Systema Naturæ* (ed. 1767), i. 1,072.) Cuvier made the Mollusca one of the four great "divisions" or sub-kingdoms of the Animal Kingdom, of equal rank with the Vertebrata, the Articulata, and the Radiata. He subdivides it into six classes: Cephalopoda, Pteropoda, Gasteropoda, Acephala, Brachiopoda, and Cirrhopoda. (*Animal Kingdom* (ed. Griffith), i. 61, xii. 4-5.) Except that the last class has now been merged in Crustacea, and placed with the Articulata or Annulosa, the essential features of Cuvier's arrangement have still been preserved. In 1843 Prof. Owen arranged the Mollusca in an Acephalous division, containing the orders Tunicata, Brachiopoda, and Lamellibranchia, and an Encephalous division, with the orders Pteropoda, Gasteropoda, and Cephalopoda. (*Compar. Anat. Invert. Animals* (ed. 1843), p. 269.) Mr. S. P. Woodward recognised six classes: Cephalopoda, Gasteropoda, Pteropoda, Brachiopoda, Conchifera, and Tunicata. (*Manual of the Mollusca* (ed. 1851, 6-8.) Prof. Huxley separates from the already limited class Mollusca a class Molluscoida (q.v.). (*Introd. to Classif. of Animals* (ed. 1869), p. 82.) Dr. Henry Woodward defines the Mollusca as animals with a soft body, without segments, naked or covered with a shell of one or two valves composed of carbonate of lime secreted by a fold of the skin—the mantle. They have a brain-mass, and foot and mantle ganglia. Some have an internal hard shell or cartilage. The symmetry of the body is bilateral. Example, the cuttle-fish, the snail, the oyster, &c. He makes Tunicata and the Molluscoida an "intermediate group," and divides the sub-kingdom into four classes: Cephalopoda, Gasteropoda, Pteropoda, and Conchifera. (*Cassell's Nat. Hist.*, v. 153-4.) Many thousand recent Mollusca are known, distributed throughout every climate and nearly every part of the world.

2. *Palæont.:* The shells of the Mollusca being all but indestructible, and easy of identification, afford us a reliable means for ascertaining the relative age of strata. As some, moreover, inhabit fresh water, others the land, besides the large numbers which find their home in salt water, they often settle the fresh-water or marine origin of a stratum. The marine ones being distributed also in certain zones of salt water, they frequently afford materials for sounding a sea which passed away ages ago. Next to the Protozoa, the oldest fossils known are Mollusca. They have abounded from Cambrian times till now. The longevity of molluscous species (not individuals) is much greater than that of the Mammalia. Hence, Lyell's arrangement of the tertiary formations in accordance with the relative percentage of recent and fossil species must not be extended beyond the Mollusca.

mŏl-lŭs-cŏĭd'-a, *s. pl.* [Lat. *mollusc(a)* (q.v.)., and Gr. εἶδος (*eidos*) = form.]

1. *Zool.:* A primary division of Mollusca instituted by Milne Edwards, and in Professor Huxley's classification, one of the eight primary groups into which he divides the animal kingdom. He places it between the Mollusca and the Cœlentcrata. The mouth is provided with ciliated tentacula, disposed in a circle or in a horseshoe shape, or fringing long arms; it leads into a large or sometimes exceedingly large pharynx, and in two or three the atrial system is greatly developed. Dr. Henry Woodward says that the Molluscoida have the body, with shells placed differently to those of the Mollusca, or have a tubular or shell-like covering. The gills are more or less free or fringed with cilia, without the usual lamellæ of the Mollusca, and they serve for the capture of food as well as for respiration; or there may be a crown of ciliated tentacles. It includes the Bryozoa and the Brachiopoda. These in their structures, embryonic and adult, show resemblance to those of Vermes, Mollusca, and Tunicata. Prof. Huxley divides the Molluscoida into three classes: Ascidoida, Brachiopoda, and Polyzoa. (*Introd. to Class. Animals*, 115, 116.)

Molly Maguires, *s. pl.*

History, &c.:

1. A secret society formed in Ireland, in 1843, to intimidate bailiffs or process-servers distraining for rent, or others impounding the cattle of those who were unable or unwilling to pay rent. The members of the association were young men dressed up in female attire, and having their faces blackened.

"These *Molly Maguires* were generally stout active young men, dressed up in women's clothes, with faces blackened or otherwise disguised; sometimes they wore crape over their countenances, sometimes they smeared themselves in the most fantastic manner with burnt cork about their eyes, mouth, and cheeks. In this state they used suddenly to surprise the unfortunate grippers, keepers, or process-servers, and either duck them in bog-holes, or beat them in the most unmerciful manner, so that the *Molly Maguires* became the terror of all our officials."—*Trench: Realities of Irish Life*, ch. vi.

2. A similar society formed in 1877 in the mining districts of Pennsylvania. The members sought to effect their purpose by intimidation, carried in some cases to murder. Several were brought to justice and executed.

2. *Fig.:* Some dread or irresistible influence or passion, at the shrine of which everything would be sacrificed.

II. *Technically:*

1. *Compar. Relig.:* The distinctive idol of the Ammonites (1 Kings xi. 7). The commonest spelling of the word is Molech (Lev. xx. 2, 3, Jer. xxxii. 35.) Amos has Moloch (v. 26). To show that Moloch and Milcom are the same, cf. 1 Kings xi. 5, 7. The Malcham of Zeph. 1, 5 much resembles Milcom: in Hebrew it means "their king." Perhaps it means Molech in 2 Sam. xii. 30, and Jer. xlix. 1, 3. Molech was the Ammonite fire-god. He had a connection with the planet Saturn (the Chiun (?) of Amos v. 26). Though the offering of children to Moloch was forbidden in the Mosaic law (Lev. xx. 2, 3), it was introduced not later than the reign of Solomon. Its special seat during the Hebrew monarchy was in the Valley of Hinnom. [Gehenna, Tophet.] Probably at first the children were placed in the fire, and left there till they were consumed (Lev. xx. 2, 3; Jer. vii. 21); then after humanity, perhaps at the instance of the mothers, began to assert itself over cruel superstition, the children were passed hastily through the fire, so as to give them at least some hope of life (Lev. xviii. 21; Jer. xxxiii. 35). [Needfire.]

2. *Zool.:* A genus of Lizards, family Agamidæ. It contains but one species, *Moloch horridus*, from Australia. It is about six inches in length, armed on the head, body, limbs, and tail, with spines of large size, whence its popular name, Thorn-devil.

They derive their name from the quantity of milk-food eaten by them.

Chem.: A metallic, hexad element, discovered by Hjelm in 1782; symbol, Mo; atomic weight, 95·5; molecular weight unknown; sp. gr. 8·6. It is of rare occurrence, but is found in combination, with sulphur as molybdenite, MoS''_2; with oxygen in molybdenum ochre, MoO_3; and as lead molybdate, MoO_2PbO, in wulfenite. The metal is obtained by heating molybdic anhydride, or one of the chlorides, to redness in a current of hydrogen. It is a silver-white, brittle, almost infusible metal, permanent in air at ordinary temperatures, but when heated it oxidizes, and is ultimately converted into molybdic anhydride. It is not attacked by dilute hydrochloric or sulphuric acids, but is readily dissolved in aqua-regia, or in hot concentrated sulphuric-acid. Molybdenum forms with oxygen the following oxides: hypomolybdous oxide, MoO; dimolybdous trioxide, Mo_2O_3; molybdous oxide, MoO_2, and molybdic anhydride, MoO_3, all of relatively slight importance. It forms four chlorides, $MoCl_2$, Mo_2Cl_6, $MoCl_4$, and $MoCl_5$; and three sulphides, MoS_2, MoS_3, and MoS_4, the last two being acid sulphides, and forming sulphur salts.

The movement of a force is:—

(1) *With respect to a point:* The product of the force into the distance of its point from its line of action.

(2) *With respect to a line:* The product of the component of the force which is perpendicular to the line, into the shortest distance between the line and the direction of this component.

Bot.: A genus of Cucurbitaceæ, tribe Cucurbiteæ. The leaves are lobed or compound, the flowers white or yellow, monœcious or dioecious. Males with three stamens and zigzag anthers, two of them two-celled, the third one-celled. Fruit fleshy, prickly, or warty. Found in the hotter parts of both hemispheres. *Momordica Charantia* has a bright orange-yellow fruit, one to six inches long. It is cultivated throughout India. Two varieties of it are known in Bengal. After being washed in hot water to diminish its bitterness, it is eaten by the Hindoos in their curries. It is used in India internally as a laxative, and as an ointment for sores; the juice as a mild purgative for children; the astringent root in hæmorrhoids. The fruit and leaves are used as an anthelmintic, also in piles, leprosy, and jaundice. The former is tonic, stomachic, and given in diseases of the spleen and liver. *M. dioica* grows wild in India, where the young and tender fruit is eaten by the natives with the tuberous roots of the female plant. The root is used also to stop bleeding from piles, and in bowel complaints. Ainslie says that when mixed with cocoanut, pepper, and red sandal-wood and applied in the form of a liniment it relieves headache. *M. cochinchinensis* is eaten. The fruit of *M. Balsamina* has a smooth orange or yellow fruit, one to four inches long. Pickled or steeped in oil, it is a vulnerary. *M. mŏn'-ą-chĭsm, *s.* [Fr. *monachisme,* from Eccles. Lat. *monachus* = a monk.] The system of monastic life; monkery, monkishness.

"What labour is to be endured turning over volumes of rubbish in the rest, Florence of Worcester, Huntingdon, Simeon of Durham, Hoveden, Matthew of Westminster, and many others of obscurer note, with all their *monachisms,* is a penuance to think."—*Milton: Hist. Eng.,* bk. iv.

¶ The ultimate fact on which monachism rests is that many people are born with a tendency to contemplation rather than to active exertion, and, if pious, consider that they will be more free from temptation to sin by retiring from the ordinary world. Hot climates tend to strengthen these feelings, and monachism has flourished more luxuriantly in Asia, Africa, and Southern Europe, than in the colder north.

(1) *Ethnic Monachism:* The most gigantic development of monachism the world has ever seen was that of Booddhism (q.v.), and it was the earliest in point of date. The Jain system is also monastic. Brahmanism possessed it to a less, but still to a considerable extent. Of the Hindoo Triad the worship of Brahma scarcely exists; connected with that of Vishnu and Siva there are many monastic orders or sects. Of the former, Dr. Horace Hayman Wilson enumerates nineteen, and of the latter eleven, with fourteen others, some sub-divided (*Works* (1862), i. 12). Curiously enough, most of them arose about the same dates as the leading religious orders of Christendom were instituted, as if Oriental and Western minds advanced equally, or some cause had operated simultaneously both in the East and the West.

(2) *Jewish Monachism:* The Nazarites were an ascetic sect temporarily under vows, but not bound to celibacy, which is nowhere enjoined even on priests under the Mosaic law. Elijah and John the Baptist had monastic tendencies (1 Kings xvii. 3, 4, xix. 1-9; 2 Kings i. 8; Matt. iii. 4). But genuine Jewish monasticism, with its celibacy as well as its asceticism and seclusion from society, seems to have begun with the Essenes (q.v.), and to have been continued by the Therapeutæ (q.v.).

(3) *Christian Monachism:* In the second century certain persons who aimed at stricter piety than their neighbours, often held converse together without quite separating from society. They were called ascetics, and were the successors of the Therapeutæ, who prepared the way for the rise of monachism. In the third century Paul ranged through the desert of Thebais in Upper Egypt during the Decian persecutions. He and others who acted similarly were called Anachorets or Anchorites, or persons who retire from society, recluses, solitaries [Anchorite], also eremites or hermits, that is, persons who live in the desert. [Eremite.] They frequently resided in caves. In 305 Anthony, an Egyptian monk, collected many of the eremites into communities. These were called cœnobites from their living in common. In this he was largely assisted by his disciple Pachomius. The same discipline spread through Western Asia and Europe. From among the Eremites who lived apart from each other sprung the Sarabaites and Gyrovagi (Vagabond monks), disreputable races, the Stylites, or Pillar Saints, associated for ever with the name of Simeon, who died in 451, with other ramifications. At first all the monastic establishments followed the rule of Pachomius, but in the early part of the sixth century St. Benedict introduced new regulations, and all the monastic orders for some centuries were Benedictine. Many ordinary monks becoming corrupt, the new Order of Canons was instituted in the twelfth century, and, as the great wealth which their communities had acquired was believed to be one of the main causes of that corruption, there arose, in the beginning of the thirteenth century, different mendicant orders, the members of which vowed poverty. [Mendicant-orders.] At first all the monks were laymen; now they consist of three classes: (1) priests; (2) choir monks, in minor orders; and (3) lay-brothers, who act as servants and labourers. Originally they were under the jurisdiction of the bishop, but ultimately they were exempt from all authority except that of the Holy See. The influence of the mendicant orders was on the wane at the Reformation, and the Jesuits took their place. At that date many monasteries in England and elsewhere were deprived of their endowments and suppressed. Those of France were swept away in the first Revolution. Though since restored, they have not attained their former importance. [Monastery, Monk, Nun.]

Zool.: A name usually given to a sub-order of Silicispongiæ, more properly called Monaxonidæ (q.v.), since they are characterized by being uni-axial, not by being one-rayed.

mŏn'-ăd, *s.* [Lat. *monas* (genit. *monadis*) = a unit, from Gr. μονάς (*monas*) = a unit, from μόνος (*monos*) = alone, single; Sp. *monada;* Ital. *monade.*]

I. *Ord. Lang.:* An ultimate atom or molecule; a simple substance without parts; a primary constituent of matter.

2. *Philol.:* A monosyllabic word or root; specif., a monosyllabic root of the isolating class of languages.

3. *Philos.:* A term first used by Giordano Bruno (circ. 1548–1600), and adopted in a slightly different sense and brought into prominence by Leibnitz (1648–1716). To avoid the Atomism of Gassendi, he conceived a number of true unities, without extension, but endowed with the depth of an internal life, thus distinguishing them from atoms. (*Merz.*)

"*Monad* is the term given by Leibnitz to simple unextended substance; that is a substance which has the power of action . . . All *monads* have ideas, but the ideas of the different *monads* are of different degrees of clearness. God is the primitive *monad*, the primary substance; all other *monads* are its fulgurations. God has none but adequate ideas. Every soul is a *monad*. Plants and minerals are, as it were, sleeping *monads* with unconscious ideas. In plants these ideas are formative vital forces; in animals they take the form of sensation and memory; in human souls they disclose themselves in consciousness, reason; they approach, though they do not attain, the clearness of the adequate ideas possessed by God."—*Hist. Pantheism*, ii. 207, 208.

4. *Zool.:* (See extract).

"No better illustration of the impossibility of drawing any sharply defined distinction between animals and plants can be found, than that which is supplied by the history of what are termed *Monads*. The name of *Monad* has been commonly applied to minute free or fixed, rounded or oval bodies, provided with one or more long cilia, and usually provided with a nucleus and a contractile vacuole. . . . Some are locomotive conditions of indubitable plants; others are embryonic conditions of as indubitable animals. Yet others are embryonic forms of organisms which appear to be as much animals as plants; and of others it is impossible to say whether they should be regarded as animals or as plants."—*Huxley: Anat. Invert. Animals*, pp. 44, 45.

Spain, Austria and Hungary, Finland, Roumania, Servia, Bulgaria, and Monaco have also coined large amounts of either or both gold and silver into money, of weight, fineness, and value, exactly proportionate to, or identical with, that of the countries included in the convention. 1. Any substance or device which, by law or custom, serves as a common medium of commercial exchange; specifically, coins and paper currency so employed.

2. A conventional system, with suitable nomenclature, in terms of which values [prices] are expressed and debits and credits computed; as the dollar, franc, pound, &c. In this sense known as *money of account*, being, from the nature of things, an ideal or immaterial device and thus distinguished from monetary tokens, or currency.

3. *Fig.:* Property, exchangeable wealth.

¶ In all civilized countries money is a creation of law, and therefore has no legal existence, as money, outside of the jurisdiction under which it is created. [See Fiat Money.] By legislative convention a nation or people may endow any substance whatsoever with the monetary function, and even with the legal tender quality; its usefulness as a medium of exchange will then depend upon the degree of exchangeability it may possess, and this will be determined by the amount of confidence it may command amongst its users. Confidence may be inspired (1) by the use of valuable material in the substance of the currency; or (2) by implicit belief of the good faith and wealth (resources) of the issuing power. There seems to be no good reason for the employment of a costly material for the substance of a currency, except to create a degree of confidence that the government stamp cannot inspire. Savage tribes and nomadic races are obliged to use a bartering or commodity system in their exchanges, but a higher civilization performs more than nine-tenths of its monetary operations by means of paper currency. With us, therefore, credit has practically supplanted commodity in currency, although we still employ metal as a so-called standard of value in pursuance of a plan which is, in effect, an effort to force our money of account into conformity, in the exchanges, with a given weight of a selected commodity. The purpose of this is professedly to secure a stable monetary unit, but the effect is actually the reverse. Stability in the price of the selected commodity is thus generally secured, as a matter of course, since such price is expressed in the terms of the commodity itself: but this gives no assurance of stability in the purchasing power of the unit so maintained.

Metal in the shape of coined money will circulate as currency so long as the bullion contained therein is not greater in exchange value (as expressed in the current money of account) than the amount indicated on the face of the coins; when it exceeds this, the coins circulate no longer and cease to be money—*i. e.*, a common medium of exchange. The metal is then said to be at a premium, which really means that it has increased in price beyond its legal limit as a money metal. Or, the metal may fall below the coinage price, as silver has done: it will then remain in circulation, although said to be at a discount. The terms premium and discount in this connection are hardly correct, for the operation is clearly that of a mere rise, or fall, in the price of the metal as expressed in the terms of the current money of account, such rise or fall being due to the action of the natural law of commodity. Commodity money—*i. e.*, currency made of, or specifically redeemable in, gold or silver, or both—is essentially a system of hartering these commodities for all others, and is therefore practically equivalent to similar transactions employing sheep, oxen, tobacco and coonskins, as in the older days; with, however, this important difference: that we now inflate the currency by issuing large quantities of credit paper, which is nominally sound because of its convertibility into coin, but which really owes its integrity and utility to our known possession of vast general wealth.

For the purpose of fine economic distinction, the term money is often applied only to the function of money—the office it performs—the word currency being used to designate the various substances and devices that have been endowed with that function.

¶ *Redemption of Money:* Money (currency) is essentially a ticket or order entitling the holder to receive a quantity of goods or other service equal in price to the amount indicated on the face of the order. Redemption actually occurs when such money is received in exchange for other things; but technically the operation is performed when other money is exchanged for it, as gold coin for "greenbacks," at our subtreasuries.

¶ *Money of the World:* In the international exchanges there are no transactions in money, as such, and cannot be. The unit of international exchange is almost universally the grain of gold—a weight and not a monetary unit. [See Par (1), *s.*, II. (6).]

They established two bishops or patriarchs, one at Alexandria, with jurisdiction over Egypt and Abyssinia; and the other at Antioch, with jurisdiction over Syria and Armenia. 3. The assuming or claiming right to or possession of anything to the exclusion of others; as, He claims a *monopoly* of the conversation.

II. *Law:* Some of the early sovereigns of Europe assumed the right of granting to certain favored subjects the *monopoly*, or sole right of selling and dealing in particular commodities. This pretended prerogative was carried to a most injurious length in the reign of Queen Elizabeth, and led to the passing of the Statute of Monopolies, 21 Jac. I., c. 3; which, while declaring the illegality of such grants of exclusive trading in general, contained an exception in favor of new and original inventions in manufacture. Upon this exception, which, to a certain extent, recognizes the royal prerogative, the modern law of patents for inventions in manufactures may be considered to rest. In the United States the monopolies in patents and copyrights are the only ones that legally exist, but the trust or trade syndicate—a combination of those engaged in the same business—usually becomes a monopoly on a large scale, competition being prevented by various means. Certain governments retain monopolies, as in tobacco, salt, &c., purely for revenue purposes.

Church Hist.: The doctrine of the Monothelites, that Christ had but one will in His two natures.

¶ The Greek emperor Heraclius, having consulted Sergius, patriarch of Constantinople, a Syrian, descended from Monophysite parents, as to how that sect could be reconciled to the Church, the prelate gave it as his opinion that it might be held, without prejudice to the truth or to the authority of the Council of Chalcedon, which had condemned the Monophysites, that, after the union of the two natures in Christ, there was but one will and one operation of will. In 630 Heraclius issued an edict, requiring the acceptance of this tenet, and for a while he seemed successful; but in 633 Sophronius, a monk of Palestine, opposed Monothelitism at the Council of Alexandria, and the following year, being made Patriarch of Jerusalem, he assembled a council and condemned it. Sergius of Constantinople still maintained his old opinion, and in 639 drew up, in the name of the emperor, an Ecthesis, or formula of faith. The same year Pope John IV., in a council held at Rome, rejected the Ecthesis and condemned the Monothelites. They were again condemned in the sixth Œcumenical Council (Constantinople), 680–681. The Maronites of Lebanon embraced Monothelitism, but were reconciled to the Church in 1182.

There is an outer clavicular bone, and the coracoid bones are extended to the anterior end of the sternum. In various respects they approach birds. They to a certain extent connect mammals with reptiles. Darwin believes that the earliest mammals in some respects resembled Monotremata. It contains two genera, Ornithorhynchus (Duckmole), and Echidna (Porcupine Ant-eater) both Australian forms. On Tuesday, Sept. 2, 1884, a telegram was received from Sydney, from Prof. Liversidge, by the British Association, then at Montreal, intimating that Mr. Caldwell, the Balfour student sent out to Australia, had discovered the Monotremes to be oviparous: The development of these eggs bore a close resemblance to that of the Reptilia, proving, as Prof. Moseley said, that the Monotremes were more closely connected with the Sauropsida than with the Amphibia. Monroe-doctrine, *s.*

Hist.: A term applied to the declarations made by the United States during the second presidency of James Monroe (1821–1825). The first had John Quincy Adams for its author; it assumed that every spot of the Old World was covered by the flag of some civilized power, and so would be free from American encroachment, and asserted

"That the American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European power."

The second declaration related to the apprehended attempt of the Holy Alliance (q.v.) to subjugate the Spanish American States which had revolted. In his annual Message of 1823 President Monroe declared that the United States would consider any

"attempt of the Allied Powers to extend their system to any portion of this hemisphere as dangerous to our peace and safety."

II. *Meteorology:*

1. (*Pl.*): A modification of the trade winds, operative from the Tropic of Cancer to Lat. 7° S., and from the coast of Africa through the Indian Ocean and the Bay of Bengal to Japan and the Western Pacific. There are two monsoons, the South-western and the North-eastern. The latter prevails from October to April, and the former from April to October. The bursting of the monsoon commences the rainy season in India, the south-western bringing that of Bombay and Central India, and the north-eastern that of Madras and other parts of the east coast. [Rainy-season.] The monsoons are caused by the unequal heating of the land and water and of the several land masses themselves in the regions which they affect. Independently of their great use in bringing rain to countries which otherwise would degenerate into deserts, they are useful for navigation. As in the case of the trade winds, navigators can so plan their voyages as to take advantage of the monsoons, though powerful steamships can now achieve the feat of running in the teeth of the monsoon, but not without some discomfort to those on board.

2. Any similar wind blowing half the year in one direction and half in the other.

I. *Ordinary Language:*

1. The quality or state of being monstrous or out of the ordinary or common course of nature.

"We desire no records of such enormities; sins should be accounted new, that so they may be esteemed monstrous. They omit of *monstrosity* as they fall from their rarity; for men count it venial to erre with their forefathers, and foolishly conceive they divide a sin in its society."—*Browne: Vulgar Errours*, bk. vii., ch. xix.

2. That which is monstrous; a monster; a monstrous or unnatural production.

"We shall tolerate flying horses, black swans, hydras, centaurs, harpies, and satyrs; for these are *monstrocities*, rarities, or else poetical fancies."—*Browne: Vulgar Errours*, bk. v., ch. xix.

II. *Animal & Veget. Physiol.:* A character appearing in an individual animal or plant, which is very rare in the species to which it belongs. It is abnormal in the sense of being exceptional, but not in the sense of being produced as a mere sport of nature iudependent of law. "By a monstrosity," says Mr. Darwin, "I presume is meant some considerable deviation of structure, generally injurious or not useful to the species." (*Orig. of Spec.* (ed. 6th), p. 33.) They arise in mau, in the inferior animals, and in plants. Idiocy, hermaphroditism, albinoism, the possession of an unusual number of fingers or toes, more teats than two, two heads, or no head at all, physical union by flesh, cartilage, or bone to any other individual, &c., are cases of human monstrosity. Monstrosities which graduate into slight variations are so similar in man and the lower animals, that the same classifications and the same terms, as has been shown by Isidore Geoffroy St. Hilaire, can be used for both. (*Darwin: Descent of Man*, p. 30.) Among some of the many monstrosities of the lower animals may be mentioned that discoidal shells occasionally become spiral, and fossil periwinkles from the Norwich Crag are often distorted. (*S. P. Woodward: Mollusca* (ed. 1875), p. 37.) All cases of monstrosity are to be accounted for by law. In most cases they are caused by arrest of development, in some by reversion to the character of a remote ancestor, in others by hypertrophy of a particular part.

Church Hist.: The religious system of Montanus, an inhabitant of a Phrygian village, called Pepuza, who, about 171 A.D., proclaimed himself the Paraclete or Comforter promised by Jesus [Paraclete], and professed

to utter prophecies. Amongst others he was supported by two ladies, Prisca, or Priscilla, and Maximilla, who also claimed the gift of prophecy. He multiplied fasts, forbade second marriages, did not permit churches to give absolution to those who had fallen into great sin, forbade all female ornaments, required virgins to be veiled, and would not sanction flight in persecution. He was ultimately expelled from the church. Tertullian, in the year 204, joined the Montanists, but did not forfeit the respect of the church catholic, as the Montanists held the fundamental doctrine of Christianity, and differed from others more in their rigid practice than in their faith. (1) Properly the time in which the moon makes one complete revolution round the earth, or appears to return to precisely the same point in the heavens from which it started. This may be from change to change, from full moon to full moon, or in an indefinite number of other ways. The time of the revolution now described is properly 29 days, 12 hours, 44 minutes, and 3 seconds. Twelve periods, called lunar months, fall short of a year by about 11 days. Lunar months were used by the ancient Jews, as they still are by their modern successors and by the Muhammadans.

"Thirty days hath September,
April, June, and November;
All the rest have thirty-one,
But February twenty-eight alone,
Except in leap year once in four,
When February has one day more."

3. *Law:* Formerly, the word month in a statute meant a lunar month, but by 13 Vict., c. 21 it was made to signify caleudar month, unless otherwise expressly designated. It does so also in ecclesiastical law, but by common law and equity it is 28 days.

1. *Astron.:* The single satellite attendant on the earth. Its diameter is 2,160 miles, that of the earth (which is 7,918 miles) being nearly four times as great. Its superficial extent is about a thirteenth part of the earth's surface; its bulk is $\frac{1}{49}$ that of the earth, but as the earth is relatively heavier, its weight is about eighty times that of the moon. As the moon revolves round the earth it manifests phases. After absence for a few nights it reappears as a delicate crescent of white light in the western sky after sunset. Night after night it moves farther to the east, the illuminated portion of its disc continually increasing till the moon becomes full and rises about sunset. When the light of the moon has again so diminished that it is in its last quarter, it is seen high in the heavens in the morning. When it becomes full, the sun and the earth are so nearly in a straight line that the moon narrowly escapes being eclipsed; when new moon is again reached, the sun is nearly undergoing similar obscuration. [Eclipse.] The moon shines only by the light of the sun reflected from its surface. To equal the brilliance of the sun 600,000 full moons would be required. The moon appears at all times nearly of the same size, showing that its orbit cannot be far from circular. Its average distance is 240,000 miles, varying at times between 220,000 and 260,000, but the ordinary fluctuations do not exceed 13,000 miles on either side of the mean value. The moon performs a complete revolution around the earth in 27 days, 7 hrs., 43 min., and 11·461 secs. This is called its sidereal period. The lunar month is longer than the sidereal period by 2 days, 5 hrs., 51·41 secs., because of the advance of the earth in the orbit between two successive conjunctions of the moon. As the moon revolves on its own axis nearly in the same time as it completes its orbit round the earth, it presents to us at all times nearly the same side of its surface. No clouds appear on it; apparently there is no water to send them forth nor an atmosphere in which they may float. The whole surface is studded with volcanoes, apparently extinct. Their craters are broad, beyond anything existent on the earth. Tycho is 50 miles across, so is Aristotle, Theophilus is 64, and Petavius 78. Some are 16,000 or 17,000 feet deep. From the absence of an atmosphere the moon must be uninhabitable by any life analogous to that with which we are acquainted.

2. *Ecclesiol. & Church Hist.* (*Pl.*): A religious sect, called at first Bohemians, and constituting a branch of the Hussites, who, when the Calixtines came to terms with the Council of Basle, in 1433, refused to subscribe the articles of agreement, and constituted themselves into a distinct body. Their tenets were evangelical. In 1522 they made advances to Luther, who partially recognized them, but they ultimately adopted Calvinistic views as to the Lord's Supper. Their discipline was very strict. They supervised the conduct of their members in their private or secular affairs, as well as in their ecclesiastical relations. They refused to bear arms. Driven by persecution, they scattered abroad, and for a time their chief settlement was at Fulnek in Moravia, whence they were called Moravian Brethren, or Moravians. On May 26, 1700, was born Nicolaus Ludwig, Count von Zinzendorf, son of the chamberlain and state minister of Augustus II., Elector of Saxony and King of Poland. From early life the son was devoted to religion, his piety being of the mystic type. Having met with a Moravian refugee, who told him of the persecutions to which his sect was exposed in Austria, Count Zinzendorf offered him and his co-religionists an asylum on his estate. The man, whose name was David, accepted the offer, and in 1722 settled, with three other men, at a place called by Zinzendorf Herrnhut (= the Lord's guard). Under his fostering care, the sect greatly increased in strength, and were often called, from their place of settlement, Herrnhutters. Till his death, on May 9, 1760, he travelled, largely spreading their views. Small Moravian churches arose on the Continent, in England, in Ireland, and in America. Though they have never been numerous, yet in the latter part of the eighteenth century and the beginning of this, they acquired great reputation from having a larger proportion of their membership engaged in foreign missions than any Christian denomination since apostolic times. Cowper, Dr. Chalmers, and others wrote of them with high admiration. Called also the United Brethren.

Mor'-mŏn (2), *s.* [Named from a mythic personage, Mormon, who, according to Joseph Smith, led a Jewish immigration into America in early times.]

Ecclesiol., Church & Civil Hist. (*Pl.*):

The popular name for the members of a religious body calling themselves "The Church of Jesus Christ, of Latter-day Saints," or more briefly, the Latter-day Saints. Their founder was Joseph Smith, a farmer's son, born in Sharon, Windsor County, Vermont, Dec. 25, 1805. He asserted that on Sept. 21, 1823, as he was praying, a supernatural light shone in his room, and an angel appearing made revelations to him, and next day gave him certain engraved plates, with an instrument called the Urim and Thummim (cf. Exod. xxviii., 30; Lev. viii. 8), by the aid of which he translated them, publishing the result in 1830 as the Book of Mormon. On this, the Rev. Mr. Spalding, a Presbyterian preacher, declared that, having some time before written a work of fiction which no publisher could be induced to print, his rejected "copy" had been lost or stolen, and had reappeared as the angelically revealed Book of Mormon. To silence Spalding, both the faithful and the unbelievers clamoured for a sight of the plates. After eight of the former had obtained a look at them, Smith asserted that he had handed them over to the custody of an angel, and they were seen no more. On April 6, 1830, the first Mormon church was founded in the town of Manchester, in Ontario County, New York State. Others followed in quick succession. Persecution driving the Mormons from place to place, in 1839 they commenced to build a city. This was called Nauvoo, and was adorned with a fine temple. On June 24, 1844, Smith was arrested and imprisoned in Carthage State jail on a charge of treason and sedition; and on the 27th, he and his brother Hyram were shot dead by a brutal mob which broke into the jail. Brigham Young was appointed to succeed him as prophet and revelator. In 1847 he removed with many Mormons to a secluded valley called that of the Salt Lake, then Mexican Territory, but afterwards ceded to the United States. The industry of the Mormons soon made it like a garden; but when it was found to be exactly on the route to the Californian gold-diggings it ceased to be secluded. On Oct. 17, 1874, Brigham Young was convicted by the United States' Divorce Court of polygamy and imprisoned; and on Jan. 26, 1877, John O. Lee, a Mormon bishop, was executed for participation in a cold-blooded massacre of a caravan of immigrants nineteen years before.

Mor'-mŏn ĭsm, *s.* [Eng. *Mormon; -ism.*]

They hold the doctrine of the Trinity, the atonement, baptism by immersion, the Second Advent, and the restoration of Israel; they deny original sin. They recognise Joseph Smith and his successors as prophets and revelators; they claim for some of their number miraculous gifts. Polygamy was considered lawful and largely practiced until prohibited by act of Congress, after which, on October 6, 1890, the practice was formally renounced by a vote of the Mormon people in conference.

Some attain a length of from three or four feet; others remain small. The flesh is said to be excellent eating. *Mormyrus oxyrhynchus* was venerated by the ancient Egyptians (*Juvenal*, xv. 7), and frequently occurs in emblematic inscriptions. On each side the tail in this genus there is an oblong capsule, with numerous compartments, and containing a gelatinous substance. It has no electric functions, but evidently represents a transitional condition from muscular substance to an electric organ. The extent of the dorsal and anal fins varies greatly; in some species the snout is short and obtuse, in others long and decurved, with or without appendage.

mor'-phĭne, mor'-phĭ-ą, *s.* [Morpheus.]

Chem.: $C_{17}H_{19}NO_3$. Morphinum. The most important of the opium bases, discovered by Sertürner in 1816. It is obtained by decomposing an aqueous extract of opium by chloride of barium, and allowing the chloride of morphia to crystallize out. The crystals, which contain codeine, are dissolved, and the morphine is then precipitated by ammonia, and finally purified by recrystallization. It crystallizes from alcohol in colourless, lustrous, trimetric prisms, soluble in 500 parts of boiling water, easily soluble in alcohol, but insoluble in ether and chloroform. Morphine is also soluble in caustic alkalis, but scarcely at all in ammonia. Solutions of morphia are coloured blue with ferric chloride; and iodic acid is reduced by morphine and its salts, free iodine being liberated. By the aid of starch solution this reaction affords a highly delicate test for its detection. Morphine forms well-defined salts with mineral and orgauic acids. The most characteristic and best defined salt is the hydrochloride, which crystallizes in slender, colourless needles arranged in stellated groups, soluble in 20 parts of cold water, and in its own weight at the boiling heat.

1. *Nat. Science:* That branch of science which treats of the laws, form, and arrangement of the structures of animals and plants, treating of their varieties, homologies and metamorphoses; the science of form.

¶ Darwin defined it as "The law of form or structure, independent of function," and considered it to be one of the most interesting departments of natural history, and, indeed, almost its very soul. Morphology teaches that most organs of a plant, including the bracts, sepals, petals, stamens, and pistils, are modifications of leaves. With regard to animals, it investigates the tissues of which their structures are composed [Histology], the states through which each animal has to pass before reaching maturity [Embryology], and the modifications of form which the same organ undergoes in different animals. For instance, the hand of a man, the forefoot of a mole, adapted for digging, the leg of the horse, the paddle of the porpoise, and the wing of the bat are all only modifications of one type. [Comparative anatomy.] Darwin accounts for this by the hypothesis of selection by successive slight modifications. Morphology treats also of serial homologies in the same animal, and of what Ray Lancaster calls homogenous and homoplastic homologies of orgaus. (*Darwin: Orig. Species*, 6th ed., pp. 382-86.)

1. A dance borrowed or imitated from the Moors, usually performed by a single person, with castanets or rattles in the hands; a morisco.

2. A rustic dance performed in spring and summer time. There are many records extant to prove the universal popularity of this dance, both in the parish accounts of several

dates and in the writings of poets of various periods. Douce, in his illustrations to Shakespeare, supposes that the morris-dance derives its name from the Moors, among whom it originated, and that it is the same that gave rise to the fandango. It was probably brought to England in the time of Edward III., when John of Gaunt returned from Spain. Few vestiges can be traced of it beyond the time of Henry VII.

mor'-tar, mor'-tĕr, *s.* [A.S. *mortere*, from Lat. *mortarium* = a mortar; Fr. *mortier.*]

1. A vessel, generally in the form of a bell or conical frustum, in which substances are pounderd by a pestle. When large, they are made of cast-iron; a smaller size is made of bronze, and those for more delicate pharmaceutical operations are of marble, pottery, porphyry, or agate. They are used in connection with a pestle, which in the larger mortars is of iron, and in the smaller is of porcelain or agate. A mortar should be able to resist scratching by steel, quartz, or flint, should not be stained if sulphate of copper or muriate of iron be left in it for twenty-four hours, and should not be abraded by the rubbing down of an ounce of sharp sand to a fine

powder. The pestle should possess the same character.

"In Greece they have a cast by themselves, to temper and beat in *morters*, the mortar made of lime and sand."—*P. Holland: Plinie*, bk. xxxvi., ch. xxiii.

2. A calcareous cement. It differs in its characteristics according to the nature, proportions, or treatment of its constituents. The proportions vary from 1½ to 4 or 5 of sand to 1 of lime. Hydraulic mortar is made from certain limestones which include in their composition so large a proportion of iron and clay as to enable them to form cements which have the property of hardening under water, and are called hydraulic limestones. The proportions of clay vary in different quarries, and often in the same from eight to twenty-five per cent.

"They had brick for stone, and slime for *mortar*."—*Genesis* xi. 3.

3. Short pieces of ordnance used to force shells at high angles, generally 45°, the charge varying with the range required. They are distinguished by the diameter of the bore, such as 13in., 10in., and 8in., which are the commonest forms of smooth-bore mortars. They are made of cast iron or bronze; but, recently, rifled mortars, resembling short howitzers, have been tried, and these are of wrought iron or steel. The bronze mortars are usually of small calibre, and are called "Royals" or "Coehorns," with 5⅔ in. and 4⅖ in. calibre. They are employed in the advanced trenches because of their portability. All mortars have the trunnions at the breech of the piece, and are mounted in a rigid bed of wood or iron so that they always fire at the same angle of elevation, and have little or no recoil. They are extensively employed in the bombardment of towns or forts, as the projectiles reach the interior of such places well, have great penetrative power because of the height to which they are thrown, and hold large bursting charges which afford a great volume of flame. Smooth-bore mortars are very inaccurate in their fire, as the projectile travels somewhat slowly, and is much affected by wind. The German rifled mortars give excellent results at 2,200 yards range.

mort-gāġe (*t* silent), * **mor-gage,** *s.* [O. Fr. *mortgage, mortgaige*, from *mort* = dead (Lat. *mortuus*), and *gage* = a pledge.]

Law: The grant of an estate or other immovable property in fee in security for the payment of money, and on the condition that if the money be duly paid the grant shall be void, and the mortgagee shall reconvey the property to the mortgager. The term is applied: (1) To the act of making such grant; (2) To the deed by which such grant is made; (3) To the rights thereby conferred on the mortgagee. Formerly a bill of foreclosure of a mortgage gave the mortgagee absolute ownership of the estate, unless the mortgager paid the debt, with interest and costs, by a certain date. By the present law a power of sale is implied, the proceeds of the sale, after enough has been retained to satisfy the debt, belonging to the mortgager. The laws governing mortgages differ in different parts of the United States. In some states the mortgage creates an estate in the premises, with power of ejectment; in others the mortgagee's rights can only be enforced by a suit at law; in a third class, no estate in the property is created, and the debt can only be collected by a sale of the premises. The third class embraces New York, Georgia, California, and Oregon. In some states chattel (personal property) mortgages are legal.

"But mortuum vadium, a dead pledge, *mortgage* (which is much more common than the other), it is when a man borrows of another a specific sum (*e.g.* £200) and grants him an estate in fee, on condition that if he, the mortgagor, shall repay the mortgagee the said sum of £200 on a certain day mentioned in the deed, that then the mortgagor may re-enter on the estate so granted in pledge."—*Blackstone: Comment.*, bk. ii., ch. 10.

Nine kinds of mulberry tree—some of them species, others only varieties—occur in India. *M. serrata* is valued by the Simla wood-carvers. *M. indica*, wild in the sub-Himalayas, is cultivated through India. A. *As adjective:*

1. A term applied in its widest sense to any work which exhibits a representation on a plane surface by the joining together of minute pieces of hard, coloured substances, such as marble, glass, or natural stones united by cement (mastic), and which served as floors, walls, and the ornamental coverings of columns. Roman mosaic consists of pieces of artificial enamel, in place of natural stone. The enamel is drawn out into rods of various sizes, cut into lengths, and arranged in cases something after the manner of printing type, the boxes containing each a different shade or colour. [Mosaic-Glass.] Some of the ancient Egyptian beads were thus made. The Tunbridge wood-mosaic of England is made of coloured parallelopipeds of wood glued together so as to show a pattern at their ends or sections. The oldest and simplest form of mosaic work is the dice-shaped pavement, or *musivum opus*, of the Romans. The *opus tesselatum* was a tesselated geometrical pavement. The *opus sectile* was formed of slices of marble. The mosaics which we may term modern were commenced in the latter part of the fifteenth century, and are attributed to the two brothers Zuccati, of Treviza, who executed them by means of cartoons drawn by the best artists of the day, and from copies furnished by Titian and Tintoretto, and in Italy the copying of celebrated pictures by Raphael, Domenichino, and others is continued to the present day. A finer kind is applied to the production of brooches, &c.

2. *Pyro.:* A pyrotechnic device consisting of a surface with diamond-shaped compartments, formed by two series of parallel lines crossing each other. The effect is produced by placing at each intersection four jets of fire which run into the adjoining ones. The intervals between the jets must be associated with the discharge of others, so as to keep up a succession of fires in the spaces.

mosaic-floor, *s.* A floor laid in coloured woods, tiles, or marbles, systematically arranged, either symmetrically or pictorially.

mosaic-glass, *s.* Mosaic glass is formed by the association of various coloured opaque or transparent rods of glass, so arranged that the ends may form patterns. Sections being removed, the pieces are arranged for the pro-

duction of a recurring pattern, or a general combination is formed by the association of a variety of separate ornaments.

Chem.: SnS_2. Bisulphide of tin. Prepared by exposing a mixture of 12 parts of tin, 6 of mercury, 6 of sal-ammoniac, and 7 of flowers of sulphur, to a low red heat. It forms brilliant gold-coloured scales, and is used as a substitute for gold powder.

mosaic-tile, *s.* A tile moulded with different coloured clays, arranged in patterns in imitation of the associated pieces of coloured stones in a true mosaic.

mosaic-wool, *s.* A form of rug or mat made from coloured wool, arranged so that the ends of the wool present a definite pattern. Threads of wool of equal length are placed horizontally in a frame, close together, to form a compact mass. They are of different colours, and the colours are arranged in conformity with a pattern. The threads, being held firmly in the frame, are then cut across to form cubical masses, all the threads in each cube being kept rigidly in their places. The cube is then placed in a frame with the threads vertical, and a clean cut made across the top. The smooth surface is then wetted with a solution of rubber, and a piece of canvas firmly attached. When dry, a machine cuts off a slice of such thickness as is desired for the length of the pile. A rug or mat of a velvety finish is thus produced. Other slices can be cut off in the same way until the wool is exhausted.

These are the Mihrab, or Hall of Prayer, which marks the direction of Mecca [Kiblah], and which must consequently have had a different position in different countries; then a place for the ablutions, which precede prayer; and, finally a large space for the entry and departure of the faithful, for the reading of the Koran and prayers. In this space are the Maksura, or seat of the Caliph, when one was required; as also a place for the preservation of the Koran, and finally the Mimbar, or kind of pulpit. Entom.: The popular name of various two-winged insects, having a long proboscis, with which they attack man, sucking his blood. They belong chiefly to the genus Culex, or at least the family Culicidæ; though Humboldt says that those of South America are species of Simulium (q.v.). The mosquito of the West Indies and parts of America is *Culex Mosquito*. Mosquitos abound also in the tropical parts of the Eastern World, and are troublesome too in the Polar Regions. They so much resemble each other in appearance and coloring that the number of species and their geographical distribution have not been perfectly determined. It is the female mosquito which attacks man. In hot weather mosquitoes often appear in great swarms, particularly in places where standing water affords them convenient breeding places, and their bite becomes an intolerable nuisance, the poisonous effects often continuing for several days. "Mosquito curtains" of fine gauze are the only effectual safeguard against them. In some countries the natives smear themselves with oil or grease, or sit in the smoke of smouldering fires, as a protection against them. Scarcely any part of the earth is free from these pests. [Culex.]

(1) The movement of a single part with reference to intervals taken by it. Conjunct motion takes place when the sounds move by single degrees of the scale, *e.g.*, C, D, E, F; disjunct motion is when they move by skips, *e.g.*, C, F, D, G.

(2) The movement of two or more parts with relation to each other. Similar or direct motion is when parts move in the same direction either by single degrees or by skips; contrary motion is when parts move in opposite directions; oblique motion is when one part remains stationary while another moves.

¶ 1. *Laws of motion:* Three principles or axioms laid down by Sir Isaac Newton:

(1) If a body be started in motion, and if no force act upon it, that body will continue in motion in the same direction, and with the same velocity. Of course this cannot be directly proved by observation, no one being able to start a body in a portion of the universe free from other bodies which will attract it, and if he could start it on in a vacant space, he could not watch its subsequent progress through infinite space and eternity. But the length of time during which tops will spin or finely mounted pendulums will go in the exhausted receiver of an air-pump, can be accounted for in no other way than by supposing the truth of the first law of motion. (*Airy: Pop. Astronomy*, pp. 218–220.)

(2) Change of motion is proportional to the acting force, and takes place in the direction of the straight line in which the force acts.

(3) To every action there is always an equal and contrary reaction; or, the mutual actions of any two bodies are always equal and oppositely directed in the same straight line.

2. *Organic molecular motion:* A kind of motion occurring in nearly all the internal processes in organic bodies. It must exist to produce absorption, secretion, &c. (See *Todd & Bowman: Physiol Anat.*, i. 60.)

C. *As substantive:*

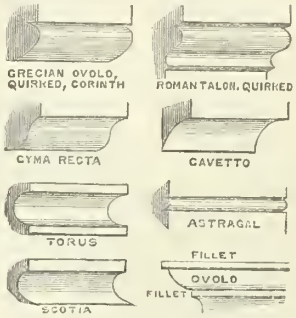
I. *Ordinary Language:*

1. The act of forming or casting in a mould.

2. Anything cast or formed in or as in a mould.

II. *Figuratively:*

1. *Arch.:* A term applied to all the varieties of outline or contour given to the angles of the various subordinate parts and features of buildings, whether projections or cavities, such as cornices, capitals, bases, door or window jambs and heads, &c. There are eight sorts of regular mouldings: viz., the ovolo, the talon, the cyma, the cavetto, the torus, the astragal, the scotia, and the fillet. These mouldings are not to be used at hazard, each having certain situations adapted to its reception, to which it must always be applied.



MOULDINGS.

Thus, the ovolo and talon, from their peculiar form, seem intended to support other important mouldings or members; the cyma and cavetto, being of weaker contour, should only be used for the cover or shelter of other parts; the torus and astragal, bearing a resemblance to a rope, appear calculated to bind and fortify the parts to which they are applied; the use of the fillet and scotia is to separate one moulding from another, and to give a variety to the general profile. The ovolo and talon are mostly placed in situations above the level of the eye; when below it, they should only be applied as crowning members. The place for the scotia is universally below the level of the eye. When the fillet is very wide, and used under the cyma of a cornice, it is termed a corona; if under a corona it is called a band. The curved contours of mouldings are portions of either circles or ellipses. In Norman architecture the mouldings were almost universally rounds and hollows variously combined, and frequently broken up into zigzag lines. In English architecture of the Middle Ages the mouldings are bolder.

2. *Joinery:* A mode of ornamentation by grooved or swelling bands, or forms following the line of the object. There are numerous varieties, as the bead, the astragal, the cavetto, the echinus, the fillet, the fascia, the ovolo, the ogee, the cyma, the recta or reversa, the quirk, the bolection, &c. A moulding is said to be stuck on or laid on, according to whether it is made on the edge of the frame or on a detached slip.

3. *Min.:* The ore found on the top of veins near the surface of the ground.

4. *Shipbuild.:* Giving the correct outline and depth to ship's timbers, &c. It is one part of the operation of forming (q.v.).

mound-builders, *s. pl.*

1. *Anthrop.:* The name given to a prehistoric race, formerly inhabiting the Mississippi Valley, who have left some very remarkable earthworks as their only memorials, for even tradition is silent on the subject. The best known group of mounds is near Newark, Ohio, and consists of "elaborate earthworks, in the form of a circle, octagon, and square, and enclose an area of about four square miles, on the upper terrace, between two branches of the Licking River. Scattered over the same plain, and crowning the neighbouring hills, are numerous tumuli or mounds, evidently erected by the same people that built the larger works." The human remains found in these mounds are usually so much decayed as to preclude the recovery of a single bone entire. This fact Squier and Davis regard as evidence of the great antiquity of the mounds, since in England, where the moist climate is much less favourable for the preservation of such remains, perfect skeletons have been found after being buried eighteen hundred years. (*Marsh*, in *Amer. Journ. Science*, July, 1866.) Wilson does not attribute to them so high an antiquity:

"But while the *mound-builders* are essentially prehistoric, according to all New World chronology, there is nothing in the disclosures hitherto made calculated to suggest for them an extremely remote era. . . . The probability rather is that the ruins of Clark's Work on Fort Ancient may match in antiquity with those of England's Norman keeps, and even that their builders may have lingered on into centuries nearer the age of Columbus."—*Prehistoric Man*, 321, 322.

1. *Geog.:* Mountains usually exist in chains, the highest being the Himalayas. Kinchingunga (28,176 feet) was considered the highest till the discovery, in Dec. 1843, of Mount Everest (29,002 feet). The Andes come next. Their highest peak is Sorata (25,267 feet). The highest peak in North America is Mount Logan, in British America, near Alaska (19,500 feet). The Alps are the highest mountains in Europe, Mount Blanc (15,744 feet) being the loftiest peak. Parallel to a leading mountain chain there are in some cases two others of inferior elevation, one on each side. Thus, parallel to part of the Himalayas are the Siwalik Hills, or Sub-Himalayas, of inferior elevation to the central chain. In studying the geography of a country, the mountains or hills claim attention first, for from them flow the rivers, and the direction of these regulates the position of the towns, the most powerful factors in political geography.

2. *Geol.:* In 1833 M. Elie de Beaumont published the hypothesis that a variety of independent mountain-chains have been thrown up suddenly at particular periods, and that all such chains which have risen contemporaneously are parallel to each other, though widely apart. Sir Chas. Lyell controverted these views, and proved that every great mountain is the result, not of one upheaval, but of many. (*Lyell: Prin. of Geol.*, ch. xi.) The composition of the different parts of a mountain regulate its form; trappean rocks, for instance, tending to make one or more table-lands with precipitous sides, and granite a rounded top. [VOLCANO.]

The term mountain implies that, in England where, in one place, according to Prof. Hull, it is 4,000 feet thick, it rises high above the surface, constituting precipices, &c. It is often cavernous; it is well developed in Derbyshire, South Wales, and Somerset. Typically it is massive, well-bedded, light bluish gray, reddish, or black in colour, in some parts homogeneous, in others crystalline. In Scotland it separates into thin calcareous strata, alternating with yellow and white sandstone, dark shale, and seams of coal and limestone. In some places the mountain limestone is composed mainly of broken encrinites, in others of foraminifera, corals, bryozoa, &c. Of mollusca: 334 lamellibranchs, 206 gasteropods, with various pteropoda and cephalopoda, have been found in it; and more than seventy species of fossil fish. It was deposited in an ocean which extended as far as the United States, Canada, and Arctic America. Their chief doctrines were that the distinction of Persons in the Trinity is merely nominal; that God has a real human body, and that when he suffered on the cross he left Elijah as his vicegerent in heaven. *The Divine Looking-glass* was published in 1656 as an exposition of their teachings, and in 1846 some members of the sect, which is now nearly, if not quite, extinct, subscribed to republish it.

Several species occur in the waters of Europe and North Africa. *M. proboscideus*, a fresh-water species from Central America, has the snout pointed and fleshy, thus resembling the genus Agonostoma. Muhammadan-architecture, *s.* The style of architecture adopted by Muhammadan nations, as the Moors of Spain, the Arabs, &c. It was gradually developed out of the forms which were found ready to hand in the various countries over which they spread, and which belonged for the most part to early Christian art of the later Roman period, together with an admixture of Asiatic elements. In the earliest times Christian churches were utilized for the practice of the new religion; afterwards mosques were erected. [MOSQUE.] In accordance with the Oriental manner of life, this style is internal rather than external, especially in palaces and dwelling-houses. Whilst the tasteless exterior of the buildings only displays to the eye high walls which are irregularly pierced by small windows, and those few in number, every thing in the interior is richly decorated. The richest ornamentation is lavished on the most essential part of these buildings, namely, on the porticos which surround the open court. There are no fixed orders or proportions for the pillars, sometimes they are squat and heavy; at others slender and graceful, especially in the later period. Three different forms of arches are found, besides the circular arch, which is of rare occurrence. In Egypt and Sicily the pointed arch, resembling that afterwards adopted in the Gothic style, was used; in Persia and India the keel-arch (the ends of the curves are bent slightly upwards like the keel of a vessel); and in Spain the horseshoe arch, which consists of a larger segment of a circle than a semicircle. The walls over these arches, as all flat surfaces, were covered with embellishments in the shape of arabesques consisting of flat relief in stucco, or painted in brilliant colours. They are formed of the most multifarious entwinings of straight or curved lines or belts. Domes are introduced freely, and are, for the most part, flat or plain externally, or ornamented with stripes like a gourd. Dwelling-houses are tasteless externally, but the interiors display wealth and luxury. Overhanging balconies are used in the upper stories, and the windows are small and elevated. The Arabian system of ornamentation is not so pure as the Moorish, and the Turkish style kept more closely to the Byzantine. The finest specimen of Muhammadan architecture and ornamentation is the Alhambra, at Granada.

Mŭ-hăm'-ma-dan-ĭşm, Mŏ-hăm'-mĕ-dan-ĭşm, Ma-hŏm'-ĕt-an-ĭşm, *s.* [Arab. *Muhammad;* Eng. suff. *-an; -ism.* Muhammad is from the Arabic root *hamd* = the Praised.]

Compar. Religions: The religion founded by Muhammad, the so-called Prophet of Arabia. He was born at Mecca, of good family, Aug. 20, 570, but, while an infant, lost his father, Abdallah, and, at the age of six, his mother, Amina. When a child he had a fit, probably epileptic. At the age of twenty-five he married Khadijah, a widow of forty, the first of his many wives, and was faithful to her while she lived. At the age of forty he often retired to a cave at the foot of Mount Hira for religious meditation. Three years later he began to proclaim his views, and, after a time, claimed to be a prophet. Among his early converts were his wife, Khadijah, Ali, his cousin, then a boy of fourteen, afterwards his adopted son and his son-in-law, and Abu Bakr, or Abubeker, his friend. On June 20, 622, he had to flee from Mecca to Medina. This date is the Moslem era of the Hejira (q.v.). At Mecca he had been an enthusiast, at Medina he became a fanatic. On Jan. 13, 624, at the head of 300 followers he defeated 950 of the Meccans. The victory was considered miraculous, and encouraged him in future to propagate his faith by the sword, and he was so successful that at his death (June 8, 632) he was virtual sovereign of Arabia. During the Caliphates of his immediate successors Abubeker (632–634) and Omar (634–646), the Arabs, or Saracens, conquered Syria, Persia, and Egypt, and established the new faith. Othman reigned next (644–655). Then the Arabs elected Ali, Muhammad's son-in-law, strangely passed over till now; the Syrians chose Moaviah, son of Abu Sofian, an old enemy of the prophet. Civil war resulted, and the sects of the Sunnis and Shiahs arose. Ali was assassinated in 661, Hassan and Hossein, his sons, soon after perishing. In 710 Tarik landed in Spain, the straits where he had passed and the adjacent rock being ever afterwards called Gibraltar (q.v.). In 732 Charles Martel (= the Hammer) defeated the Arab Abderrahman at Poictiers, saving Western Europe. The Saracen capitals had been successively at Medina, at Cafa, at Damascus, and at Bagdad, their dynasties were the Ommeyades, Abbasides, &c. About the middle of the eighth century, the Saracen empire in the East began to be broken down by the Turks, then a savage Tartar tribe, who afterwards embraced Muhammadanism, and in 1453 took Constantinople, terminating the Greek or Eastern empire. Since the sixteenth century their power has been less dreaded. The Muhammadans of the world have been estimated at 250 millions, of whom 50 millions are in India, 40 millions directly under British rule, and 10 millions in allied or tributary states. The Koran (= that which is read or recited) is their sacred book and their code of law. Their faith is called Islam (= surrender of the will to God). Five duties are incumbent on the faithful Muhammadan: a confession of faith that there is but one God, and that Muhammad is his prophet, prayer, fasting, almsgiving, and a pilgrimage to Mecca. Friday is their sabbath and day of special worship. Raising the nations which have embraced it to a higher creed than their old idolatry, Islam has so stereotyped them as to render all further changes intensely difficult. No other faith offers so stubborn a resistance to the spread of Christianity.

I. *Ordinary Language:*

I. *Lit.:* In the same sense as II. 1.

2. *Fig.:* A stubborn, sullen person.

II. *Technically:*

I. *Zool.:* A term loosely used as synonymous with hybrid (q.v.), more usually applied to the produce of a male ass with a mare, the Mule proper (*Equus asinus,* var. γ), and to the Hinny (*E. asinus,* var. δ), the offspring of a stallion and a she-ass. The mule does not attain maturity so soon as the horse, but is useful for a much longer period. As a beast of burden it is in some respects preferable to the horse; it is easily fed, is equally good for carrying and drawing, its less sensitive skin enables it to support exposure to the weather; like the ass, it enjoys comparative immunity from disease, and it is as surefooted as a goat. Mules have been known from the earliest ages; there are frequent references to them in Scripture, and in Greek (*Od.* viii.) and Latin (*Plautus, Aul.,* iii. 5, 21) literature. France is the most important mule-raising country in Europe; then come, Italy, Spain, and Portugal, where they are used for pack and draught. Kentucky, Missouri, and Kansas take the lead in the United States, and the Mexican mule (by a male ass from a mustang mare) is a very useful animal. Mules are seldom used, and seldomer bred, in England. They are largely employed as draught animals in warfare, probably for the first time in the English service in the Peninsular War, but they have since been used in the Crimea, India, Abyssinia, South Africa, and Egypt. Breeding between mules and either parent is not very rare, but has long been deemed impossible between mules *inter se* (*Suetonius: Galba,* iv.),

but it has been stated to have occurred within recent years between mules at the Jardin des Plantes and (on doubtful authority) between hybrids of birds. In the *Proceedings of the Zoological Society* (1884) is a paper by Mr. A. D. Bartlett, the superintendent, describing a remarkable hybrid boru in the Gardens. On Oct. 29, 1868, a female hybrid was born from a Gayal cow (*Bibos frontalis*) and a Zebu bull (*Bos indicus*); from this female hybrid and a Bison bull (*Bison americanus*) a second female hybrid was born on May 21, 1881, from which and a Bison bull a third female hybrid was born, March 12, 1884—the offspring of certainly three well-marked species, and, accordiug to preseut definition, of three distinct genera.

"The belief, so general, that all hybrids or *mules* are barren and useless for breeding purposes is simply a stupid and ignorant prejudice."—*Proc. Zool. Soc.*, 1884, p. 401.

2. *Bot.:* A hybrid; a cross between two distinct species. They are produced by the application of the pollen of one to the stigma of the other. Mules between two different genera are called bigeners. They are rarely obtained.

3. *Farr.:* A disease in horses.

4. *Spinning:* A spinning-machine in which the rovings are delivered from a series of sets of drawing rollers to spindles placed on a carriage, which travels away from the rollers while the thread is being twisted, and returns toward the rollers while the thread is being wound. It was inveuted by Samuel Crompton, and perfected in 1779. The combination which gave rise to the term mule was the junction of the drawing rollers of Arkwright with the spinning-jenny of Hargreaves. The object of the machine is to deliver the roving with the required degree of attenuation and twist it as delivered. For this purpose, the spindles, instead of being stationary, are placed on a movable carriage, which is wheeled out to twist the threads and wheeled in again to wiud on the spindles.

Ichthy.: The popular name of the genus Mullus and of the family Mugilidæ. The former are distinguished as Red, and the latter as Gray Mullets. Red Mullets are ground-feeders, using their barbels in discovering their food; it was believed that they fed on putrid flesh, but probably they are attracted to decomposing bodies by the small crustaceans which feed thereon. Little is known of their habits; in winter they retire into deep water, in summer they approach the coasts, and are sometimes found in brackish waters. They are brilliantly coloured, and as food-fish should claim the attention of pisciculturists. The Gray Mullet is plainly coloured, greenish on the upper parts, and more or less silvery on the sides. The flesh is well-flavoured, and it is largely cultivated in the fish-farms of Western Italy.

Ichthy.: A sub-genns of the family Mullidæ, closely resembling the sole genus Mullus, as the name denotes.

mŭl'-lŭs, *s.* [Lat.]

Ichthy.: The typical and only genns of the family Mullidæ. *Mullus barbatus* is, according to Dr. Günther, the sole species, of which he considers *M. surmuletus* to be the female. It was highly prized by the Romans, who paid extravagant prices for it, especially when it attained a considerable size, a circumstance often noticed by the satirists, especially by Martial (x. 31) and Juvenal (v. 92). It was the custom to bring the fish into the banqueting-room that it might die in the presence of the guests, its red colour becoming exceedingly brilliant in its death-struggles. Fishermen deepen the natural tint of the fish by scaling it immediately after capture, causing a permanent contraction of the chromatophores containing the red pigment. [Mullet (1), *s.*]

It is open in the direction of the prevailing wind, which is conducted down the descending chute and thence disseminated through the house. It consists of a long wooden framework, to which planks are nailed, according to the length and breadth desired. If cheaper materials be required, the framework is covered with reeds or mats, plastered. They are common features in Cairene architecture, where their presentation is usually N.W., being towards the prevailing wind."—*Knight's Dictionary of Mechanics.*

The product is the result obtained by taking one of the quantities as many times as there are units in the other. The quantity to be multiplied or taken is called the multiplicand, the quantity by which it is to be multiplied is called the multiplier, and the result of the operation is called the product. Both multiplicand and multipliers are called factors of the product. Multiplication is a simple and compendious process of addition. Thus, $5 \times 5 = 25$ is the same as $5+5+5+5+5$. Simple multiplication is when the terms are abstract numbers, and compound multiplication when the multiplicand is a concrete number, as pounds, shillings, and pence, miles, yards, and feet, &c.

Unless the current is sensibly diminished by the resistance of the wire, each convolution exerts an equal force on the needle, thus multiplying the deflective force as many times as there are turns in the wire. Owing to the resistance, however, it frequently occurs in practice that a few turns of stout wire exert a greater influence on the needle than many convolutions of much finer wire.

II. *Technically:*

1. *Archæol.:* The name given to animal remains chemically preserved from decay by various processes of embalming. By far the larger number of mummies that have been brought to light are human, for, according to the religious law of ancient Egypt, some process of mummification was universally obligatory; but it was also the custom to embalm cats, crocodiles, ichneumons, and other sacred animals. Recent researches have established the fact that the practice was due to the belief in the necessity of preserving the body inviolate in readiness for the resurrection. The living man was supposed to consist of a body, soul, intelligence, and a shadowy *ka*—the mere aspect of the man. At death the intelligence was free to wander through space; the soul had to pass a probationary period in the under-world; the *ka* dwelt in the tomb with the mummied body, and, if this were destroyed or damaged, the *ka* suffered in like manner. Hence it was customary to deposit portrait statues of the wealthier Egyptians in their tombs to provide against the *ka* being left without a body. The British Museum has two statues of this description, from the tomb of Seti I., of the Nineteenth Dynasty. The Egyptian practice of mummification had a wide range in time. Miss A. B. Edwards (*Ency. Brit.* (ed. 9th) xvii. 21) fixes its commencement at from 3800 to 4000 B.C., and Dr. Birch considers it to have continued till about A.D. 700. The ancient Peruvians practised a kind of mummification; and the Guanches, the aborigines of the Canaries, employed a method of embalming similar to that of the Egyptians, filling the hollow caused by the removal of the viscera with salt and an absorbent vegetable powder.

II. *Gr. & Rom. Myth.:* One of nine nymphs or inferior divinities, distinguished as the peculiar protectresses of poetry, painting, rhetoric, music, and generally of the *belles lettres* and liberal arts. They were the daughters of Zeus and Mnemosyne (Memory). Originally there appear to have been only three of these divinities, and their names—Mneme, Melete, and Aœde, or Memory, Reflection, and Song—sufficiently show the nature of the faculties over which they were supposed to preside. According as the fine and liberal arts were cultivated and expanded, the province of each muse seems to have been more restricted; and additions were made to their number, which ultimately was fixed at nine, their names and respective functions being: Clio, the muse of History; Euterpe, of Lyric Poetry; Thalia, of Comedy and Idyllic Poetry; Melpomeue, of Tragedy; Terpsichore, of Music and Dancing; Erato, of Erotic Poetry; Calliope, of Epic Poetry; Urania, of Astronomy; and Polyhymnia (or Polymnia) of singing and harmony. Helicon and the region round Parnassus was the favourite seat of the muses, where they were supposed, under the presidency of Apollo, to be perpetually engaged in song and dance, and in elevating the style and conceptions of their favoured votaries. Apollo, as patron and conductor of the muses, was named Musagetes, "Leader of the Muses;" the same surname was also given to Hercules. They were generally represented as young, beautiful, and modest virgins, usually apparelled in different attire, according to the arts and sciences over which they presided, and sometimes as dancing in a chorus, to intimate the near and indissoluble connection between the liberal arts and sciences. Their worship was universally established, particularly in Greece, Thessaly, and Italy. No sacrifices were offered

to them; but the poets invariably prefaced their compositions with a solemn invocation for the aid and inspiration of the muses.

The science of music includes several branches:—1. The physics, that is, the analysis of the cause and constitution of sound, the number of atmospheric vibrations which produce given sounds, and the arrangement of series of sounds standing in a definite relationship to each other as regards their vibration-number (scales); also, the form and construction of instruments with reference to the character and nature of the sounds they produce; and also, the apparatus of experimental acoustics, such as sound-measurers (tonometers, sirens, tuning-forks, &c.). These branches, of course, involve problems of pure mathematics. 2. The physiology of music. This deals with the construction and functions of the sound-producing organs of the human body, the vocal chords, larynx, &c., and also, with the receptive organ of sound, the ear. 3. The mental philosophy of music—the effect of music on the emotions and intellect. The art of music includes the formation of melody (sounds in succession), and harmony, and counterpoint (sounds in combination); also, the "technique" of voice-production and singing, and of performing on musical instruments. The earliest efforts of mankind in music consisted of the elevation and depression of the voice in reading sacred writings and lyrical poetry, and in the construction of pipe-instruments, tubes pierced with holes (flutes), tubes containing a vibrating tongue (reed-instruments), and collections of pipes in which the sound was produced by making the breath or other column of air impinge on a sharp edge (the syrinx and the organ), in using the lips as a cause of vibrations in open tubes (the trumpet family), in the stretching of strings in a frame (the lyre and harp family), in placing stretched strings over a resonance-box (the lute and guitar family), in the use of the "bow" to excite vibrations (the viol family), and in the striking of strings over a resonance-box by means of hammers (the dulcimer and harpsichord and pianoforte family).

The ancient signs for the elevation and depression of the voice in reading were called accents (not stress, but the raising and dropping of the voice without adding to its force). These led to a system called neumes; these again led to signs called notes (*cantus mensurabilis*), the position of which on lines showed their pitch, and the shape of which determined their duration. The use of letters in various positions to represent definite sounds was an essential element of ancient Greek music, which, however, was discarded at the revival of music in the early Christian church; but the system has, in an improved form, been revived in the modern tonic sol-fa system. The earliest crude attempts at the combination of vocal sounds were called organum or diaphony; these were succeeded by an arbitrary system of harmonization called descant, which in its turn was superseded by counterpoint, the laws of which to this day govern vocal part-music, and are exhibited in their highest form in the vocal or instrumental fugue. The germ of the romantic style of music is to be found in the love-songs of the troubadours and their collateral brethren; the use of music as a language of emotion in the present day has been gradually developed from this source. The highest form of unaccompanied music is to be found in madrigals and pure vocal masses; the constant improvement of musical instruments led

to an independent branch of pure instrumental music, which, passing through fantasias and concerti, has culminated in the modern symphony. The wedding of vocal and instrumental music has led to the production of the opera and oratorio.

When freshly precipitated, it is transparent and gelatinous, but when dried it forms a loose yellow powder. It is insoluble in cold water, alcohol, and ether, but soluble in boiling water and in the alkalis. The only mycomelates known are the ammoniuin salt and the silver salt, the latter of which is precipitated in yellow flakes, when ammonium mycomelate is added to a solution of silver nitrate.

It forms shining rhombic crystals, soluble in water aud in boiling alcohol, but insoluble in ether. Its aqueous solution is dextro-rotatory, but it does not reduce cuprous oxide from alkaline cupric solutions. When boiled with dilute sulphuric acid, mycose is converted into dextro-glucose; with strong nitric acid it forms a detonating compound. Heated with acetic acid, it yields saccharides which are undistinguishable from those formed in like manuer from dextro-glucose.

Viviparous, producing only one at a birth. The species are generally of large size, from tropical and temperate seas. The dentition consists of flat molars, like a mosaic pavement, in both jaws. Dr. Günther enumerates five genera: Myliobatis, Aëtobatis, Rhinoptera, Dicerobatis, and Ceratoptera.

The claws of the thumbs and toes have each a small talon projecting from the base. The soles of the feet and the inferior surface of the legs are manifestly adhesive, and their structure leads to the belief that this species hunts for its insect food, not only in the air, but also on the branches and leaves of trees, among which its peculiarities of structure probably enable it to walk about with security and ease. Many of these Mysteries still exist. They were played by members of the different crafts or trading companies. Thus the collection known as the Chester Mysteries were acted in that city in the year 1327, and contains "The Fall of Lucifer," acted by the Tanners; "The Creation," by the Drapers; "The Last Supper," by the Bakers; "The Resurrection," by the Skinners, &c. mȳth, *mythe, *s.* [Lat. *mythos* = a fable, a myth; Gr. *μῦθος* (*muthos*) = anything delivered by word of mouth.]

I. *Literally:*

(1) *Gen.:* A fiction framed unconsciously, not a wilful falsehood. Such myths arose most copiously in the infancy of nations, but they do so yet, especially among young people or the uneducated, there being the closest analogy between the mind of early man and that of a child or of an untaught person. Every observation of nature, every event in human history, every attempt to understand language tended to the multiplication of myths. They have been divided into philosophical and historical myths, myths of observation, nature-myths, &c.

(2) *Spec.:* A philosophical myth. According to George it is the evolving of an imaginary fact from an idea, and is to be distinguished from legend, which is the evolving of an idea from a fact. When the Romans of the Augustan times, out of the idea how their polity arose, created the narrative of Æneas, his misfortunes, his wanderings, and his settlement in Italy, they framed a myth; when real historic facts become embellished by fiction, they are legendary.

"Parts of *mythology* are religious, parts of *mythology* are historical, parts of *mythology* are poetical, but *mythology* as a whole is neither religion nor history, nor philosophy, nor poetry. It comprehends all these together under that peculiar form of expression which is natural and intelligible at a certain stage, or at certain recurring stages in the development of thought and speech, but which, after becoming traditional, becomes frequently unnatural and unintelligible."—*Max Müller: Science of Religion*, pp. 252, 253.

¶ *Comparative mythology:* The comparison of the mythologies of all nations. Professor Sayce considers that it is but a branch of the science of language. N.

N, The fourteenth letter and the eleventh consonant in the English alphabet. It is a dental nasal, and is formed by placing the tip of the tongue against or close to the root of the upper teeth, and emitting a voiced sound through the nose. Its ordinary sound is that heard in *not*, *ton*, *done*, &c., but before gutturals, as *g* or *k*, it has a guttural nasal sound, almost equivalent to *ng*, as in *sink*, *link*, *finger*, *sing*, *song*, &c. When, however, the gutturals belong to a different syllable the *n* generally retains its ordinary sound, as in *congratulate*, *engage*, *engine*, &c. *N* final after *m* is sileut, as in *autumn*, *hymn*, *condemn*, &c. When preceded by *g*, *k*, *m*, aud *p* at the begining of a word, the *n* alone is sounded, as in *gnaw*, *know*, *mnemonics*, *pneumatic*, &c. *S* is always sounded before fuitial *n*, as in *snow*. At the end of a word or syllable *n* may be followed by *d*, *t*, *k* (with *g* it forms a single souud, as stated above), *s*, *sh*, *z*, or their equivalents, all of which are sounded distiuctly. In the oldest English *n* was lost before *f*, *th*, and *s*, the vowel being lengthened in consequence, as *goose* (= *gons*), Ger. *gans* [Gander], *tooth* (= *tonth*), Goth. *tunthus*. From many adverbs aud prepositions *n* has disappeared, as *beside* = A.S. *bisidan*; *before* = A.S. *beforan*; *within* = A.S. *withinnan*. It has also been lost in other words, as *ell* = A.S. *eln*; *eve* = A.S. *æfen*; *eleven* = A.S. *endleof*; *mill* = A.S. *mylen* (*miln*). *N* is found intrusive in several words, as in *nightingale* = A.S. *nichtegale*; *messenger* = Mid. Eng. *messager* (O. Fr. *messagier*); *passenger* = Mid. Eng. *passager* (O. Fr. *passagier*); *scavenger*, originally *scavager*. A final *n* has been added in a few cases, as *bittern* = Mid. Eng. *butore*, Fr. *butor*; *marten* = Mid. Eng. *mearth*. As a final, *n* has in many cases been strengthened by *d* or *t*, as in *tyrant*, *sound*, *thunder*, &c. *N* has been replaced by *m* in *smack* = A.S. *snace* (boat); *hemp* = A.S. *hanep*; *tempt* = Fr. *tenter*; *vellum* = Fr. *velin*; *comfort* = O. Fr. *confort*, Lat. *conforto*, &c. It has become *l* in *flannel*, formerly *flannen*. An initial *n* is in several cases found prefixed to a word which properly begins with a vowel; this is probably due to the final *n* of *mine* (*min*) or *an*: thus *an ewt*, *an ekename*, *mine uncle*, became respectively, *a newt*, *a nickname*, *my nuncle*. On the other hand an initial *n* has in many cases been dropped from the word, and become attached to the article *a* preceding: as, *an adder*, *an apron*, *an auger*, *an umpire*, *an orange*, for *a nadder*, *a napron*, *a nauger*, *a numpire*, *a norange*, &c.

N. *As a symbol is used:*

1. As a numeral for 900, and with a dash over it (N) for 9,000.

2. In chemistry for the element nitrogen.

N. *As an initial* is used for North as in charts N. by E. = North by East; N.B. = North Britain; for Latin *nota*, as N.B. = *nota bene* = mark or note carefully; for notary, as N.P. = Notary Public.

¶ *N.* or *M.:* Tho most probable explanation of these is that N = *Nomen*, and that *Nomen* for one person, or *Nomina* for several persons, was expressed by ℳ, *vel* ℳℕ; the double ℳ being afterwards corrupted into ℳℳ. (*Blunt: Annotated Common Prayer.*)

NAPIER'S RODS.

squares, which are again subdivided on ten of the rods by diagonals into triangles, except the squares at the upper ends of the rods. These spaces are numbered as shown in the diagram. To show the manner of performing multiplication by means of the rods, let it be required to multiply 5978 by 937. Select the proper rods, and dispose them in such a manner that the numbers at the top shall exhibit the multiplicand, and on the left of these rods place the rod of units. In the rod of units seek the right hand figure of the multiplier, which, in this case, is 7, and the numbers corresponding to it on the other rods. Beginning on the left add the digits in each parallelogram, formed by triangles of adjacent rods, and write them down as in ordinary multiplication; then take the sum of the several products as in ordinary multiplication, and it will be the product required. From the outermost triangle on the line with 7, write out the number there found, 6; in the next parallelogram on the left add 9 and 5 there found; their sum being 14, set down the 4 and carry the one to be added to 3, and 4 found in the next parallelogram on the left; this sum being 8, set it down; in the next parallelogram on the left occur the numbers 5 and 6, their sum being 11, set down 1, and carry 1 to the next number on the left; the number 3 found in the triangle on the left of the row, increased by 1, gives 4, which set down; proceed in like manner, till all of the partial products are found, and take their sum as in the example.
